This analysis sets to examine whether the results obtained on the PubMed database (Fig. 3, main text) extend to ISI Web of Knowledge, which includes journals from a wider variety of disciplines (from social sciences in particular). We conducted literature searches (January 20, 2012) on ISI Web of Knowledge for usage of “neuroeconomic*” and “decision” + “neuroscience”. Following the initial appearance of “neuroeconomic*” in PubMed (Fig. 3, main text), we started with the year 2003. A year-to-year breakdown demonstrates a fairly steady increase since 2003 in “decision neuroscience” articles, reflecting an increase in the size of the field, but a recent downward trend of articles employing the term “neuroeconomic*,” with a peak in 2008 (the same year as the results from PubMed). A similar analysis of the combination of “decision neuroscience” also demonstrated that its usage has increased relative to that of “neuroeconomic*” since the terms first appeared in the literature.
