Supporting Information

Materials and Methods. Unless stated otherwise, reactions were conducted in flame-dried glassware under an atmosphere of nitrogen using anhydrous solvents (either freshly distilled or passed through activated alumina columns). 10% Pd/C was purchased from Aldrich Chemical Company, Inc. (20,569-9). All commercially obtained reagents were used as received. Reaction temperatures were controlled using an IKAmag temperature modulator, and unless stated otherwise, reactions were performed at 23 °C. Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates, (0.25 mm) and visualized using a combination of UV, anisaldehyde, ceric ammonium molybdate, and potassium permanganate staining. ICN silica gel (particle size 0.032-0.063 mm) was used for flash column chromatography. ¹H NMR spectra were recorded on a Varian Mercury 300 (at 300 MHz) and are reported relative to Me₄Si (δ 0.0). Data for ¹H NMR spectra are reported as follows: chemical shift (δ ppm), multiplicity, coupling constant (Hz) and integration. ¹³C NMR spectra were recorded on a Varian Mercury 300 (at 75 MHz), or a Varian Inova 500 (at 125 MHz) and are reported relative to Me₄Si (δ 0.0). Data for ¹³C NMR spectra are reported in terms of chemical shift. NOESY-1D, gCOSY, and homodecoupling NMR experiments were performed on a Varian Inova 300 (at 300 MHz) or a Varian Mercury 600 (at 600 MHz). IR spectra were recorded on a Perkin Elmer Spectrum BXII spectrometer and are reported in terms of frequency of absorption (cm⁻¹). Optical rotations were measured with a Jasco P-1010 polarimeter. High resolution mass spectra were obtained from the California Institute of Technology Mass Spectral Facility. Analytical chiral HPLC was performed on a Chiralcel AD column (4.6 mm x 25 cm) obtained from Daicel Chemical Industries, Ltd.

Methyl Ester 18. To lactone 9\textsuperscript{1a} (510.1 mg, 1.80 mmol) in THF (25 mL) and freshly distilled AcOH (300 µL, 5.24 mmol) was added TBAF (1.0 M in THF, 4.0 mL, 4.0 mmol) in a dropwise fashion over 3 min. The reaction was stirred for 16 h, and then the solvent was evaporated \textit{in vacuo}. R\textsubscript{f} 0.25 (3:1 EtOAc:hexanes). This crude material was dissolved in CH\textsubscript{2}Cl\textsubscript{2} (17 mL) and pyridine (1.02 mL, 12.6 mmol) was added. A solution of Ac\textsubscript{2}O (355 µL, 3.76 mmol) in CH\textsubscript{2}Cl\textsubscript{2} (355 µL) was added via syringe pump at a rate of 170 µL/hr. After the addition was complete, the reaction was quenched by the addition of 10% (w/v) aq. citric acid (35 mL). The layers were separated and the aqueous layer was extracted with CH\textsubscript{2}Cl\textsubscript{2} (2 x 50 mL). The combined organic extracts were dried over MgSO\textsubscript{4}, and the solvent was evaporated under reduced pressure. A racemic sample was prepared as follows:

To carbonate 30 (9.9 mg, 0.03 mmol) and Pd₂(dba)₃ (2.7 mg, 0.003 mmol) was added THF (800 µL) followed by P(n-Bu)₃ (2.8 µL, 0.011 mmol), Et₃N (5.2 µL, 0.04 mmol) and formic acid (1.6 µL, 0.04 mmol).² The solution was stirred at 23 °C for 3 h, and was then heated to 70 °C for 70 min. The reaction was cooled to 23 °C, and purified directly by preparative thin-layer chromatography (4:1 hexanes:EtOAc eluent). The crude product was then re-purified by preparative thin-layer chromatography (13:4:3 hexanes:EtOAc:CH₂Cl₂ eluent) to provide an a racemic, analytical sample of 31 (5.4 mg, 61% yield).
