Supporting Information 1 (Experimental Procedures):
General. Unless otherwise stated, reactions were performed under a nitrogen atmosphere using freshly dried solvents. Tetrahydrofuran (THF) was dried either by distillation from sodium/benzophenone or by passing through activated alumina columns. Methylene chloride (CH$_2$Cl$_2$), diethyl ether (Et$_2$O), and acetonitrile (MeCN) were dried by passing through activated alumina columns. Dimethylformamide (DMF) was dried over activated molecular sieves, and MeOH was distilled over magnesium oxide. All other commercially obtained reagents were used as received. All reactions were monitored by thin-layer chromatography using EMD/Merck silica gel 60 F254 pre-coated plates (0.25 mm). Flash chromatography was performed with indicated solvents using silica gel (partial size 0.032-0.063) purchased from Silicycle. Microwave experiments were performed using a Biotage Initiator® microwave reactor. $^1$H NMR spectra were recorded at 500 MHz or 400 MHz using a Bruker AM-500, Bruker Avance DPX-500 or Bruker AM-400 instrument. $^{13}$C NMR spectra were recorded at 126 MHz or 100 MHz using a Bruker AM-500, Bruker Avance DPX-500 or Bruker AM-400 instrument. Chemical shifts are reported relative to internal chloroform ($^1$H, δ = 7.26, $^{13}$C, δ = 77.2), dimethyl sulfoxide ($^1$H, δ = 2.50, $^{13}$C, δ = 40.3), methanol ($^1$H, δ = 3.31, $^{13}$C, δ = 49.0) or methylene chloride ($^1$H, δ = 5.32, $^{13}$C, δ = 54.0) as indicated. Infrared spectra were recorded on a Midac M-1200 FTIR. Melting points were obtained on a Gallenkamp variable temperature melting point apparatus and are uncorrected. Low-resolution mass spectra were acquired on a Waters Micromass® ZQ instrument using electrospray ionization (EI). High-resolution mass spectra were acquired at the University of Illinois Mass Spectrometry Center.

$^1$H and $^{13}$C NMR spectra are included for all previously unreported compounds.

**Anilide 16.** To a solution of 2,2,3,3,4-pentamethylcyclobutane-1-carboxylic acid (15) (90 mg, 0.53 mmol, 1.0 equiv) in CH$_2$Cl$_2$ (5 mL) was added oxalyl chloride (69 µL, 0.79 mmol, 1.5 equiv) followed by a catalytic amount of DMF (2 µL), which resulted in the immediate evolution of gas. The resulting solution was allowed to stir for 30 min before being concentrated under reduced
pressure. The derived residue was taken up in CH$_2$Cl$_2$ (5 mL) and cooled to 0 °C before a solution of N-methyl-2-bromoaniline (130 mg, 0.69 mmol, 1.3 equiv) in CH$_2$Cl$_2$ (1 mL) was added dropwise. A catalytic amount of DMAP (1 mg) was added and the reaction was allowed to slowly warm to room temperature and stir overnight. The mixture was absorbed onto silica gel and subjected to flash chromatography (20% EtOAc/hexanes eluent) to afford anilide 16 (170 mg, 94% yield) as a white solid. m.p. 79-80 °C; FTIR (thin film/NaCl) 2956 (s), 2868 (w), 1661 (s), 1474 (s), 1418 (m), 1367 (w), 1278 (w), 1142 (w), 764 (w), 730 (w) cm$^{-1}$; $^1$H NMR (400 MHz, CDC$_3$) $\delta$ 7.67-7.64 (m, 2H), 7.39-7.34 (m, 2H), 7.24-7.17 (m, 4H), 3.20 (s, 3H), 3.17 (s, 3H), 2.59-2.45 (m, 2H), 2.39 (d, $J$ = 10.2 Hz, 1H), 2.12 (d, $J$ = 10.0 Hz, 1H), 1.03 (s, 3H), 0.99 (s, 3H), 0.80-0.76 (m, 12H), 0.67 (s, 3H), 0.66 (s, 3H), 0.49 (s, 3H), 0.48 (s, 3H); $^{13}$C NMR (100 MHz, CDC$_3$) $\delta$ 172.2, 172.0, 142.8, 142.6, 133.9, 133.6, 131.2, 130.7, 129.5, 129.3, 128.5, 128.4, 123.8, 123.7, 51.7, 50.8, 41.9, 41.5, 38.4, 37.1, 36.9, 36.1, 36.0, 24.0, 23.4, 23.1, 23.0, 21.2, 20.3, 19.7, 19.6, 12.9, 12.6; HRMS (EI) calc’d for C$_{17}$H$_{24}$BrNO [M$^+$] 337.1041, found 337.1038.

**Preparation of Oxindole 17.** A flame dried flask was charged with Pd$_2$(dba)$_3$ (27 mg, 0.03 mmol, 0.10 eq.), BINAP (18 mg, 0.03 mmol, 0.10 eq.), and t-BuONa (36 mg, 0.44 mmol, 1.5 eq.). The flask was then evacuated and kept under high vac. for 30 min. After backfilling the flask with nitrogen, freshly distilled dioxane (3mL) was introduced to provide a deep red suspension. This suspension was then degassed by three repeated cycles of evacuating the flask and then backfilling it with nitrogen. A solution of amide 16 (100 mg, 0.30 mmol, 1.0 equiv) in freshly distilled dioxane (3 mL) was then introduced into the flask via syringe. The resulting red suspension was then immersed in an oil bath preheated to 110 °C. Over a period of three h, the red suspension gradually faded in color and ultimately turned into a pale yellow suspension. The reaction was heated in dioxane for a total of 12 h, at which point TLC indicated the complete
consumption of starting material and formation of higher Rf products. The reaction was removed from the oil bath cooled to room temperature before dilution with Et₂O (10 mL) and poured into saturated NH₄Cl (15 mL). The layers were separated and the aqueous layer was extracted with Et₂O (3 x 10 mL). The combined organic layers were washed with brine and dried over MgSO₄. Concentration followed by absorption of the derived residue on silica gel was followed by flash chromatography (30% EtOAc/hexanes eluent) to furnish oxindole 17 (29 mg, 38% yield) as a white solid. m.p. 121.5-123.5 ºC; FTIR 2950 (m), 2925 (m), 1697 (s), 1611 (m), 1475 (w), 1345 (w), 1092 (w) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.35 (d, J = 7.3 Hz, 1H), 7.23 (dt, J = 1.5, 7.8 Hz, 1H), 7.03 (dt, J = 1.0, 7.5 Hz, 1H), 6.73 (d, J = 7.8 Hz, 1H), 3.14 (s, 3H), 2.63 (q, J = 7.0 Hz, 1H), 1.38 (s, 3H), 1.12 (s, 3H), 1.07 (s, 3H), 0.98 (s, 3H), 0.87 (d, J = 7.1 Hz, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 177.5, 144.1, 130.0, 127.2, 125.0, 121.0, 106.9, 58.3, 44.5, 43.5, 38.4, 25.7, 25.6, 24.8, 20.3, 19.1, 8.5; HRMS (EI) calc’d for C₁₇H₂₃NO [M⁺] 257.1780, found 257.1778.

**Preparation of Cyclobutanone 13.** A solution of diene 14 (8.22 g, 54.1 mmol, 1.0 eq.) and Et₃N (54.0 mL, 387 mmol, 7.1 equiv) in THF (210 mL) was brought to reflux and maintained at this temperature while isobutyryl chloride (40.0 mL, 382 mmol, 7.1 equiv) was introduced over a period of 15 h. Immediately upon the addition of isobutyryl chloride a white precipitate began to form. The mixture was allowed to reflux for an additional 12 h before the reaction was cooled to room temperature and filtered to remove the triethylamine hydrochloride salt. The solution was then concentrated under reduced pressure (rotary evaporator) keeping the temperature under 10 ºC to provide an orange oil containing a large amount of a white precipitate. To this mixture was added 750 mL of a 20% EtOAc/hexanes solution. Following removal of approximately half of this volume under reduced pressure, an additional 300 mL of hexanes was introduced and the mixture was filtered to remove the white precipitate, which consisted entirely of 2,2,4,4-
tetramethyl-cyclobutane-1,3-dione, resulting from the dimerization of dimethyl diketene. This precipitate was washed well with hexanes, and the resulting filtrate was concentrated. The resulting residue was subjected to silica gel chromatography (2-10% EtOAc/hexanes eluent) to provide cyclobutanone 13 (10.21 g, 85% yield) as a white solid. m.p. 93.5-95.5 °C; FTIR (thin film/NaCl) 3056 (w), 2993 (m), 1773 (s), 1262 (s), 1053 (m), 736 (s) cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 5.80-5.72 (m, 2H), 4.60 (dd, J = 1.9, 5.1 Hz, 1H), 4.42 (dd, J = 1.1, 5.7 Hz, 1H), 4.14 (dd, J = 2.2, 9.3 Hz, 1H), 2.73-2.70 (m, 1H), 1.38 (s, 6H), 1.35 (s, 3H), 0.99 (s, 3H); ¹³C NMR (125 MHz, CDCl₃) δ 214.2, 107.1, 71.6, 70.5, 60.0, 55.8, 32.8, 26.6, 26.2, 24.4, 24.0, 17.5, 16.6; HRMS (EI) calc’d for C₁₃H₁₈O₃ [M⁺] 222.1256, found 222.1255.

**Preparation of Ketone 21.** A solution of olefin 13 (2.00 g, 9.01 mmol, 1.0 eq.) in CH₃OH (60 mL) was treated with Rh on Al₂O₃ (10% Rh, 250 mg). The resulting suspension was purged with H₂ and then allowed to stir under 1 atm of H₂ (balloon) overnight at which point TLC indicated the complete consumption of starting material. The suspension was filtered through a small plug of celite and subsequently washed well with EtOAc. Concentration under reduced pressure was followed by purification via flash chromatography (2–5% EtOAc/hexanes eluent) to provide ketone 21 (1.43 g, 71% yield) as a white solid. m.p. 85-87 °C; FTIR (thin film/NaCl) 2937 (m), 2890 (m), 1757 (s), 1446 (w), 1376 (m), 1364 (m), 1204 (w), 1169 (m), 866 (w) cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 4.58 (dd, J = 1.9, 7.3 Hz, 1H), 4.27 (p, J = 3.9 Hz, 1H), 3.91 (dd, J = 1.5, 9.9 Hz, 1H), 2.30-2.25 (m, 1H), 2.05-1.96 (m, 1H), 1.62-1.55 (m, 1H), 1.52-1.38 (m, 2H), 1.47 (s, 3H), 1.33 (s, 6H), 1.09 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 214.2, 107.1, 71.6, 70.5, 60.0, 55.8, 32.8, 26.6, 26.2, 24.4, 24.0, 17.5, 16.6; HRMS (EI) calc’d for C₁₃H₂₀O₃ [M⁺] 224.1412, found 224.1411.
Preparation of Olefin 22. A suspension of Zn (3.39 g, 51.9 mmol, 9.0 equiv), CH₂IJ (2.10 mL, 26.1 mmol, 4.5 equiv), and a catalytic amount of PbCl₂ (25 mg) in THF (45 mL) was stirred for 15 min, during which time a slightly exothermic reaction occurred. [NOTE: In the event that this slightly exothermic reaction was not observed, the reaction was heated with a heat gun for 2-3 minutes.] This suspension was cooled to 0 °C and TiCl₄ (670 µL, 6.10 mmol, 1.06 equiv) was slowly added, resulting in a very exothermic reaction. The cold bath was removed and the resulting dark brown suspension was stirred at room temperature for 30 min, at which point a solution of ketone 21 (1.29 g, 5.76 mmol, 1.0 equiv) was introduced dropwise via cannula addition over 7 min. The reaction was stirred at room temperature for 2 h before being cooled to 0 °C and carefully quenched by the addition of 1 N HCl (100 mL) (Caution!). The entire mixture was then poured into a separatory funnel containing additional 1 N HCl (250 mL) and EtOAc (100 mL). The layers are separated and the aqueous layer was extracted with EtOAc (2 x 100 mL). The combined organic layers were then washed with 0.5 N HCl (50 mL), 50% NaHCO₃ (50 mL), H₂O (50 mL), and brine. Drying over Na₂SO₄ was followed by concentration in vacuo and purification by silica gel chromatography (2.5-3% EtOAc/hexanes eluent) to afford olefin 22 (1.09 g, 85% yield) as a pale yellow oil. FTIR (thin film/NaCl) 2979 (m), 2950 (s), 2937 (s), 2865 (m), 1671 (w), 1447 (w), 1366 (m), 1262 (s), 1208 (m), 1046 (s), 1036 (m) cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 4.75 (d, J = 3.2 Hz, 1H), 4.72 (d, J = 2.4 Hz, 1H), 4.41 (dd, J = 2.1, 7.5 Hz, 1H), 4.26 (p, J = 4.2 Hz, 1H), 3.47 (dq, J = 2.7, 8.8 Hz, 1H), 2.08-2.05 (m, 1H), 1.85-1.77 (m, 2H), 1.48-1.36 (m, 2H), 1.46 (s, 3H), 1.34 (s, 3H), 1.22 (s, 3H), 1.04 (s, 3H); ¹³C NMR (125 MHz, CDCl₃) 179.0, 106.1, 74.7, 73.9, 50.7, 41.7, 39.0, 31.9, 31.7, 28.1, 26.8, 25.7, 20.1, 20.0; HRMS (FAB) calc’d for C₁₄H₂₂O₂ [M⁺] 221.1542, found 221.1549.
Preparation of Alcohol 23. BH$_3$·DMS (5.00 mL, 1.0 M in CH$_2$Cl$_2$, 1.13 equiv) was added dropwise over 10 min to a solution of olefin 22 (977 mg, 4.40 mmol, 1.0 equiv) in THF (15 mL) at 0 °C. The solution was allowed to slowly warm to room temperature and stir overnight. The solution was then diluted with THF (15 mL), recooled to 0 °C and treated simultaneously with 2N NaOH (3.5 mL) and 30% H$_2$O$_2$ (3.5 mL). Stirring was continued at this temperature for 2 h before the reaction was quenched with 1 N HCl (25 mL), extracted with EtOAc (3 x 25 mL), washed with 5% Na$_2$S$_2$O$_3$ (25 mL), H$_2$O (20 mL), and then brine. Following drying over Na$_2$SO$_4$ and concentration, the derived residue was purified by flash chromatography (8-10% EtOAc/hexanes eluent) to provide alcohol 23 (660 mg, 61% yield) as a white solid. mp. 58-60 °C; FTIR (thin film/NaCl) 3452 (b), 2940 (s), 1456 (m), 1369 (s), 1250 (s), 1216 (s), 1165 (m), 1054 (s), 868 (m), 795 (w) cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 4.41 (t, $J$ = 7.0 Hz, 1H), 4.26 (dt, $J$ = 6.8, 9.1 Hz, 1H), 3.81 (dd, $J$ = 9.9, 11.5 Hz, 1H), 3.67 (dd, $J$ = 6.1, 11.3 Hz, 1H), 2.47-2.36 (m, 2H), 2.21 (q, $J$ = 10.2 Hz, 1H), 2.09 (bs, 1H), 2.04-1.98 (m, 1H), 1.53-1.46 (m, 1H), 1.40 (s, 3H), 1.30 (s, 3H), 1.26-1.08 (m, 2H), 1.12 (s, 3H), 0.90 (s, 3H); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$ 107.9, 74.5, 73.2, 60.0, 46.0, 41.3, 37.8, 33.3, 32.2, 28.0, 26.5, 25.5, 19.6, 18.1; HRMS (EI) calc’d for C$_{14}$H$_{24}$O$_3$ [M$^+$] 240.1725, found 240.1722.

Preparation of Acid 24. To a solution of alcohol 23 (350 mg, 1.46 mmol, 1.0 equiv) in CH$_2$Cl$_2$ (12 mL) at 0 °C was added pyridine (118 µL, 1.46 mmol, 1.0 equiv) followed by Dess-Martin Periodinane (742 mg, 1.75 mmol, 1.2 equiv). The resulting suspension was allowed to stir for 2 h before being quenched by the addition of 10% Na$_2$S$_2$O$_3$ (10 mL) and saturated NaHCO$_3$ (20 mL).
The layers were separated and the aqueous layer was extracted with CH$_2$Cl$_2$ (3 x 20 mL). The combined organic layers were washed with H$_2$O (15 mL) and brine, dried over Na$_2$SO$_4$, and concentrated to provide a residue that was filtered through a plug of silica gel (10% EtOAc/hexanes eluent) to provide an aldehyde that was carried on without further purification.

To a solution of the derived aldehyde in a mixture of t-BuOH (19 mL) and 2,3-dimethyl-2-butene (4.5 mL) at room temperature was added a solution of NaClO$_2$ (824 mg, 9.11 mmol, 6.25 equiv) and NaH$_2$PO$_4$ (805 mg, 5.83 mmol, 4.0 equiv) in H$_2$O (8 mL). The colorless solution quickly became yellow and was allowed to stir at room temperature for 1 h, at which time 1 N HCl (10 mL) was added and extracted with EtOAc (3 x 15 mL). The combined organic layers were washed successively with 5% Na$_2$S$_2$O$_3$ (25 mL), H$_2$O (25 mL), and brine before being dried over Na$_2$SO$_4$ and concentrated to furnish acid 24 (274 mg, 74% yield) as a white solid. Recrystallization from EtOAc/hexanes provided colorless crystals. mp. 155-156 °C; FTIR (thin film/NaCl) 2932 (b), 2903 (s), 2978 (s), 2755 (m), 1682 (s), 1451 (w), 1428 (s), 1368 (s), 1343 (m), 1234 (s), 1061 (m), 1047 (m), 879 (m) cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 4.42-4.35 (m, 2H), 3.06-3.00 (m, 2H), 2.12-2.05 (m, 1H), 1.87-1.82 (m, 1H), 1.63-1.50 (m, 2H), 1.45 (s, 3H), 1.36 (s, 3H), 1.33 (s, 3H), 1.20-1.10 (m, 1H), 1.03 (s, 3H); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$ 179.0, 106.1, 74.7, 73.9, 50.8, 41.8, 39.0, 31.9, 31.7, 28.2, 26.8, 25.7, 20.1, 20.0; HRMS (FAB) m/z [calc’d for C$_{14}$H$_{23}$O$_4$ [M+H]$^+$] 255.1596, found 255.1595.

**Aniline 25.** To a solution of 2-bromoaniline (5.0 g, 29.1 mmol, 1.0 equiv) in THF (90 mL) at −78 °C was added n-BuLi (2.4 M, 12.2 mL, 1.0 equiv) over 5 min. The resulting suspension was allowed to stir for 5 min before p-methoxybenzyl chloride (4.0 ml, 29.5 mmol, 1.0 equiv) (PMBCl) was added dropwise over 5 min. After stirring at this temperature for 15 minutes, the bath was removed and the resulting mixture was allowed to warm to room temperature and stir overnight, at which point a brown solution remained. The reaction was quenched with 0.5 N NaOH (500 mL) and subsequently extracted with EtOAc (3 x 150 mL). The combined organic
layers were washed with H$_2$O (100 mL) then brine, dried over Na$_2$SO$_4$ and subjected to flash chromatography (2-5% EtOAc/hexanes eluent) to provide aniline 25 (7.01 g, 83% yield) as an orange solid. An analytical sample was obtained by recrystallization from pentane/EtOAc to furnish colorless crystals. mp. 68–70 °C; FTIR (thin film/NaCl) 3399 (m), 2962 (w), 1588 (m), 1511 (m), 1425 (m), 745 (m) cm$^{-1}$; $^1$H NMR (500 MHz, CDCl$_3$) $\delta$ 7.46 (dd, $J = 1.5, 7.9$ Hz, 1H), 7.32–7.30 (m, 2H), 7.16 (dt, $J = 1.7, 7.3$ Hz, 1H), 6.92–6.91 (m, 2H), 6.65 (dd, $J = 1.0, 7.8$ Hz, 1H), 6.60 (dt, $J = 1.1, 7.2$ Hz, 1H), 4.71 (bs, 1H), 4.34 (s, 2H), 3.83 (s, 3H); $^{13}$C NMR (125 MHz, CDCl$_3$) $\delta$ 158.9, 144.8, 132.3, 130.6, 128.5, 128.4, 117.9, 114.1, 111.6, 109.7, 55.3, 47.5; HRMS (FAB) calc’d for C$_{14}$H$_{14}$NOBr [M$^+$] 291.0259, found 291.0262.

**Anilide 26.** To a suspension of aniline 25 (310 mg, 1.06 mmol, 2.0 equiv.) and acid 24 (135 mg, 0.531 mmol, 1.0 equiv.) in CCl$_4$ (1.5 mL) and dichloroethane (13.5 mL) was added polymer supported PPh$_3$ (3 mmol/g, 531 mg, 3 equiv.). The resulting suspension was heated to reflux overnight, at which point the reaction was cooled to room temperature, concentrated under reduced pressure, and filtered. Concentration and purification by flash chromatography (10-15% EtOAc/hexanes eluent) provided anilide 26 (260 mg, 93% yield), as a viscous colorless foam that existed as a mixture of rotamers. m.p 38-41 °C; FTIR (thin film/NaCl) 2981 (s), 2934 (s), 1658 (s), 1612 (m), 1584 (w), 1474 (s), 1441 (s), 1401 (s), 1244 (s), 1214 (s), 1046 (s), 730 (m), 604 (m) cm$^{-1}$; $^1$H NMR (500 MHz, CDCl$_3$) (for major rotamer) $\delta$ 7.65 (dd, $J = 1.5, 7.2$ Hz, 1H), 7.18–7.10 (m, 2H), 7.06 (app d, $J = 8.8$ Hz, 2H), 6.75 (app. d, $J = 8.7$ Hz, 2H), 6.54 (dd, $J = 2.0, 7.4$ Hz, 1H), 5.68 (d, $J = 14.2$ Hz, 1H), 4.63 (p, $J = 5.3$ Hz, 1H), 4.28 (d, $J = 5.4$ Hz, 1H), 3.81 (d, $J = 14.1$ Hz, 1H), 3.70 (s, 3H), 2.91 (t, $J = 9.6$ Hz, 1H), 2.62 (dd, $J = 1.5, 10.2$ Hz, 1H), 2.08-1.86 (m, 4H), 1.54-1.49 (m, 1H), 1.40 (s, 3H), 1.32 (s, 3H), 0.95 (s, 3H), 0.87 (s, 3H); $^{13}$C NMR (125 MHz, CDCl$_3$) $\delta$ 172.1, 171.6, 158.9, 158.8, 140.7, 133.6, 133.5, 131.8, 131.7, 130.5, 130.4, 129.5, 129.4, 129.3, 128.0, 127.7, 123.9, 123.3, 113.6, 113.5, 105.9, 15.4, 74.9,

General procedure for preparation of SmI$_2$ solution in THF.

In 50 mL round bottomed flask, finely ground samarium (Strem, 0.650 g, 4.32 mmol) was quickly flame-dried *in vacuo*. Once cooled, 25 mL of dry, deoxygenated THF was added while under N$_2$ followed by addition of solid diiodoethane (0.700 g, 2.48 mmol) with vigorous stirring (Note: diiodoethane should be a fluffy white solid. Brown/tan colored diiodoethane can be purified by washing an ethereal solution with aqueous saturated Na$_2$S$_2$O$_3$ followed by drying over MgSO$_4$, filtration, concentration, and drying *in vacuo*). After about 5 min of stirring at room temperature, the mixture became a dark green-blue color, and stirring was continued for 3 h at room temperature. The deep blue solution (~0.1 M in SmI$_2$) was allowed to settle for at least 10 min prior to use.

Preparation of oxindole 34.

Phosgene (20% soln in toluene, 0.159 mL, 0.36 mmol) was added to a solution of enone 32 (50.0 mg, 0.27 mmol) and Et$_3$N (0.083 mL, 0.59 mmol) in THF (1.35 mL) at 0 °C. The heterogeneous mixture was stirred at 0 °C for 30 min at which time volatile liquids were removed under reduced pressure. Dry Et$_2$O (10 mL) was added, the resultant suspension was filtered through a pad of Celite, and the pad was washed with Et$_2$O (10 mL). The filtrate was concentrated under reduced pressure and the residue was dissolved in dry THF (10 mL) and t-BuOH (0.026 mL, 0.27 mmol) was added. The solution was cooled to −78 °C and degassed by bubbling N$_2$ for 10 min. A mixture of SmI$_2$ (0.1 M soln in THF, 5.7 mL, 0.57 mmol) and LiCl (96 mg, 2.3 mmol) was stirred for 10 min at rt, then added via canula over 5 min to the isocyanate solution. After complete addition of SmI$_2$/LiCl mixture, the reaction solution was stirred for 2 min at −78 °C, then quenched by the addition of saturated aqueous NH$_4$Cl. The mixture was allowed to warm to room temperature, diluted with water (20 mL) and EtOAc (20 mL). The organic layer was separated and the aqueous layer was extracted with EtOAc (2 x 20 mL). The organic layer was dried over Na$_2$SO$_4$, concentrated under reduced pressure, and

purified by silica gel chromatography (gradient elution, 20→40% EtOAc/Hexanes). Oxindole 34 was recovered as a tan, viscous oil (51 mg, 88% yield).

Reduction of enone 32.

A solution of enone 32 (36 mg, 0.19 mmol) and t-BuOH (18 µL, 0.19 mmol) in THF (10 mL) was cooled to −78 °C, and was purged with N2 for 10 min. A mixture of SmI2 (0.1 M soln in THF, 4.0 mL, 0.40 mmol) and LiCl (67 mg, 1.6 mmol) was stirred for 10 min at rt, then added to the enone via canula over 5 min. After complete addition of the SmI2/LiCl mixture, the reaction solution was stirred for 2 min at −78 °C then quenched by the addition of saturated aqueous NH4Cl. The mixture was allowed to warm to rt, diluted with water (20 mL) and EtOAc (20 mL). The organic layer was separated and the aqueous layer was extracted with EtOAc (2 x 20 mL). The organic layer was dried over Na2SO4, concentrated under reduced pressure, purified by silica gel chromatography (gradient elution, 1→4% MeOH/CH2Cl2) to provide 7 mg (19% yield) of aminal 36 as a white solid and 25 mg (70% yield) of diamino diol 35 as a 4:1 mixture of diastereomers. The diastereomers of 35 decomposed to unidentified material over the course of a few hours in solution or in a few minutes if adsorbed onto dry silica gel. They could be separated

**Reduction of Phenyl Isoocyanate (37).**
Freshly distilled phenyl isocyanate (0.021 mL, 0.19 mmol) was subjected to identical reaction conditions as described for enone 32 above. The reaction was quenched at −78 °C with NaOMe (1M solution in MeOH, 1 mL) and aqueous NH₄Cl (5 mL). Following extractive workup, N-phenyl urea was isolated (26 mg, quant.) and found to be identical (¹H NMR, ¹³C NMR) to a commercially available sample.

Preparation of triazene 39.

To a solution of triazene S1¹ (1.0 g, 3.94 mmol) in THF (75 mL) at −78 °C was added t-BuLi (1.7M soln in pentane, 4.63 mL, 7.87 mmol). Stirring was continued at −78 °C for 30 min, after which time a solution of MgBr₂ (0.25M soln in THF, [freshly prepared from rapidly stirring 1 equiv dibromoethane and 1.2 equiv Mg turnings in THF under N₂ at rt], 26.0 mL, 6.57 mmol) was added. The reaction solution was stirred at −78 °C for 15 min, then a solution of ketone 13 (0.728 g, 3.28 mmol) in THF (15 mL) was added dropwise via canula. The reaction flask was immediately placed in a preheated oil bath (100 °C) and the reaction was brought to reflux. After stirring 2 min at reflux, the reaction mixture was cooled to rt, carefully quenched with water, diluted with EtOAc (200 mL) and water (100 mL). The layers were separated and the organic layer was washed with water, dried over Na₂SO₄, filtered and concentrated under reduced pressure. Analysis of the crude reaction mixture indicated that the product had been formed as a single diastereomer. Silica gel chromatography (gradient elution, 2→10% EtOAc/hexanes) provided 1.14 g triazene 39 (88% yield) as an orange foam.

Preparation of amino alcohol S2.

To a solution of triazene 39 (4.0 g, 10.0 mmol) in MeOH (1.2 L) was added a suspension of Raney Ni [400 g of 50% solution in water, prewashed with water (5x400 mL) and MeOH (3x400 mL), PYROPHORIC] in MeOH (300 mL). The reaction mixture was stirred for 30 min at rt with a mechanical stirrer. After this time, the mixture was filtered through Celite under N₂, and the Celite was washed extensively with EtOAc (4L). The combined filtrates were concentrated under reduced pressure to provide the amino alcohol S2 as a white powder. The crude amino alcohol was routinely used without purification, but chromatography on silica gel (gradient elution, 5→20% EtOAc/Hexanes) provided an analytically pure sample.

Preparation of carbamate 40.
To a rapidly stirring biphasic mixture of amino alcohol S2 (~10.0 mmol), NaHCO₃ (1.09 g, 13 mmol), t-butyl methyl ether (14 mL) and water (28 mL) was added 4-nitrophenyl chloroformate (2.23 g, 11.1 mmol). The pale yellow mixture was stirred 1h at rt at which time NaOH (23 mL of 1M solution) was added. Stirring was continued for 3 h, then the mixture was diluted with EtOAc (100 mL) and extracted with 1M NaOH (3x100 mL). The organic layer was dried with Na₂SO₄, filtered, and concentrated under reduced pressure to provide carbamate 40. Crude carbamate 40 was routinely used without purification, however silica gel chromatography (gradient elution, 10→70% EtOAc/hexanes) provided an analytically pure sample.

**Preparation of diol S3.**

Carbamate 40 was dissolved in warm AcOH (100 mL) and water (60 mL), and the solution was stirred at 70 °C for 12 h. Upon cooling, the AcOH was quenched by adding small portions of NaOH until pH 7 was indicated by litmus paper (~64 g, 1.6 mol). The reaction
mixture was partitioned between EtOAc (400 mL total) and 1M NaOH (100 mL). The aqueous layer was extracted with EtOAc (2x100 mL). The combined organic layers were dried with Na$_2$SO$_4$, filtered, and concentrated under reduced pressure to provide diol S3 as a white solid. Diol S3 was routinely used without purification, however silica gel chromatography (gradient elution, 50% EtOAc/Hexanes→10% MeOH/EtOAc) provided an analytically pure sample.

Preparation of $\alpha$,$\beta$-unsaturated ketone 41.

A suspension of diol S3 (~10.0 mmol) and dibutyltin oxide (2.6g, 10.5 mmol) in MeOH (300 mL) was stirred at reflux for 3h, after which time it was cooled and concentrated under reduced pressure. To the resulting solid was added N-bromosuccinimide (2.05 g, 11.5 mmol) and CHCl$_3$ (100 ml). The reaction solution was stirred for 30 min at rt, diluted with 400 mL EtOAc, poured into a separatory funnel, and extracted with water (2x100 mL). The organic layer was then washed once with saturated NaHCO$_3$ and brine (50 mL). The organic layer was dried with Na$_2$SO$_4$, filtered, and concentrated under reduced pressure. Purification by silica gel chromatography (gradient elution, 30→100% EtOAc/hexanes) provided $\alpha$,$\beta$-unsaturated ketone 41 as a white solid (2.2g, 74% yield over 4 steps).

Preparation of dithiolane S4.

To a solution of α,β-unsaturated ketone 41 (245.0 mg, 0.81 mmol) and 1,2-ethanediithiol (0.103 mL, 1.20 mmol) in CH2Cl2 (16 mL) at 0 °C was added BF3•Et2O (0.123 mL, 0.97 mmol). The reaction mixture was stirred at 0 °C for 5h, after which time saturated aqueous NaHCO3 (1 mL) was added. The mixture was partitioned between CH2Cl2 (50 mL) and saturated aqueous NaHCO3 (50 mL). The layers were separated and the aqueous layer was back extracted with CH2Cl2 (50 mL). The combined organic layers were dried with Na2SO4, filtered, and concentrated under reduced pressure. Purification by silica gel chromatography (gradient elution, 10→20% CH3CN/CH2Cl2) provided alcohol S4 as a white solid in approximately 95% purity; this material converted directly into keto 42.

Preparation of ketone 42.

To a solution of (COCl)$_2$ (0.089 mL, 1.01 mmol) in CH$_2$Cl$_2$ (7 mL) at −78 °C was added DMSO (0.142 mL, 2.02 mmol). The reaction mixture was stirred for 15 min at −78°C, and then alcohol S4 (190 mg, 0.5 mmol) was added dropwise as a solution in CH$_2$Cl$_2$ (25 mL). The temperature of the dry ice/acetone bath was allowed to warm to −65 °C over 20 min after which time Et$_3$N (0.57 mL, 4.04 mmol) was added. The reaction mixture was stirred at −65 °C for 5 min and −20 °C for 20 min and then quenched with saturated aqueous NaHCO$_3$. The reaction mixture was partitioned between CH$_2$Cl$_2$ (100 mL) and 1M HCl (100 mL). The organic layer was extracted with 1M HCl (2x100 mL) and brine (50 mL), dried with Na$_2$SO$_4$, filtered and concentrated under reduced pressure. Purification by silica gel chromatography (10% Et$_2$O/CH$_2$Cl$_2$) provided ketone 42 as a tan solid (140 mg, 75% yield; 46% yield from 41). Crystals suitable for X-ray diffraction were grown by slow evaporation from CH$_2$Cl$_2$/Hexanes. For crystallographic details, see Appendix 2.1.

Preparation of oxindole 44.

To a solution of ketone 42 (25 mg, 0.067 mmol) in THF (0.7 mL) was added 1,8-diazabicyclo[4.3.0]undec-7-ene (DBU, 0.004 mL, 0.026 mmol). After 3h, TLC analysis indicated complete consumption of the starting material. The reaction mixture was cooled to 0 °C, and Et₃N (0.019 mL, 0.13 mmol) and phosgene (20% solution in toluene, 0.041 mL, ca. 0.084 mmol) were added. After 30 min, the reaction mixture was concentrated under reduced pressure, suspended in dry Et₂O (10 mL) and filtered through a pad of Celite. The Celite was washed with Et₂O (10 mL) and the combined filtrate was concentrated under reduced pressure. The resulting residue was dissolved in dry THF (0.6 mL) and cooled to −78 °C. Following addition of t-BuOH (6.4 µL, 0.067 mmol), the reaction solution was degassed by bubbling N₂ for 10 min. A mixture of SmI₂ (0.1M solution in THF, 1.4 mL 0.14 mmol) and LiCl (11 mg, 0.27 mmol) that had been premixed for 10 min was added dropwise over 5 min. Stirring was maintained for 30 min at which time the reaction was quenched at −78 °C with saturated aqueous NH₄Cl. The mixture was allowed to warm to rt, diluted with EtOAc (30 mL) and washed with saturated aqueous NH₄Cl. The organic layer was dried over Na₂SO₄, filtered, and concentrated under reduced pressure. Analysis of the crude reaction mixture by ¹H NMR indicated the product had been formed as a 7:1 mixture of diastereomers [integration of the peaks corresponding to the proton adjacent to the carbonyl, 3.8 ppm (major), 3.6 ppm (minor)]. The desired oxindole 44 was isolated as a white solid as a 7:1 mixture of diastereomers (17 mg, 71% yield) following silica gel chromatography (gradient elution, 0.5→2% MeOH/CH₂Cl₂). Slow evaporation from MeOH provided a single crystal suitable for x-ray crystallographic analysis. See Appendix 2.2 for x-ray crystallographic details.

Preparation of acetate 46.

To a solution of enone 41 (900 mg, 3.01 mmol) in CH$_2$Cl$_2$ (30 mL) was sequentially added Et$_3$N (0.630 mL, 4.50 mmol), DMAP (37.0 mg, 0.30 mmol), then Ac$_2$O (0.360 mL, 3.89 mmol) and the reaction was stirred for 1 h at room temperature. TLC showed complete conversion to two spots, assigned the mono-acetate 46 and the corresponding di-acetate. The reaction was partitioned between CH$_2$Cl$_2$ and 0.1 M HCl, and the organic layer was dried over MgSO$_4$. Filtration followed by concentration under reduced pressure and purification by silica gel chromatography (gradient elution, 30% $→$ 60% EtOAc/Hexanes) provided 841 mg acetate 46 and 162 mg of di-acetate. The diacetate was treated with NaHCO$_3$ (100 mg, 1.35 mmol) in MeOH (10 mL) for 2 h. Concentration of the reaction mixture and purification by silica gel chromatography (gradient elution, 30% $→$ 60% EtOAc/Hexanes) provided an additional 105 mg 46 (946 mg total, 92% yield) as a white powder.

Preparation of chloro-ketone 48.

To a solution of acetate 46 (500.0 mg, 1.47 mmol) in THF (37 mL) cooled to −78 °C under N₂ and was added LHMDS (1M solution in THF, 1.60 mL, 1.60 mmol). The reaction was stirred 15 min, then L-selectride (1M solution in THF, 1.60 mL, 1.60 mmol) was added and the reaction was stirred an additional 30 min. After this time, a solution of NCS (0.49 M solution prepared by dissolving 1.38 g (10.3 mmol) NCS in 21.0 mL THF) was added via canula and the reaction was stirred 30 min longer then quenched at −78 °C by addition of saturated aqueous NaHCO₃ and diluted with EtOAc. The aqueous layer was partitioned with EtOAc (200 mL total), the combined organic extracts were washed with water (2 x 30 mL), brine, and dried over MgSO₄. Filtration followed by concentration under reduced pressure and purification by silica gel chromatography (gradient elution, 30% → 60% EtOAc/Hexanes) to give 397 mg (71% yield) of chloro-ketone 48 as a 7:1 mixture of diastereomers.

Preparation of silyl enol ether 50.

![Preparation Diagram]

To a solution of TIPS ether 49 (54.0 mg, 0.118 mmol) in THF (5 mL) was added LHMDS (1.0 M in THF, 0.166 mL, 0.166 mmol) while stirring under N$_2$ at −78 °C. After stirring 15 min at this temperature, L-selectride® (1.0 M in THF, 0.199 mL, 0.199 mmol) was added and reaction was stirred 45 min before addition of TBSOTf (80 µL, 0.354 mmol). The reaction was stirred an additional 30 min at −78 °C and was then quenched with saturated NaHCO$_3$ and diluted with EtOAc. The aqueous layer was partitioned with EtOAc (150 mL total) and the combined organic extracts were washed once with brine and dried over MgSO$_4$. Upon filtration, the solvent was removed under reduced pressure and the crude residue was purified by silica gel chromatography (gradient elution, 0 → 20% EtOAc/Hexanes) to give 59 mg (87% yield) of 50 as a white foam.

**Preparation of ester 58.**

In a 500 mL flask, powdered molecular sieves (1.0 g) were flame-dried *in vacuo*. After cooling to room temperature, vinyl triflate 57 (6.70 g, 11.30 mmol) was added followed by DMF (40 mL) and MeOH (10 mL, 247 mmol). The resulting mixture was stirred vigorously under N\textsubscript{2} for 30 min, after which time DIPEA (7.88 mL, 45.2 mmol), dppf (537 mg, 0.966 mmol) and Pd\textsubscript{2}(dba)_3•CHCl\textsubscript{3} (500 mg, 0.483 mmol) were added sequentially. The flask was fitted with a reflux condenser and the orange mixture was purged with CO for 5 min, then heated to 60 °C under a CO atmosphere for 1½ h. The reaction was cooled to room temperature, diluted with Et\textsubscript{2}O (100 mL) and filtered through Celite. The sieves were washed several times with Et\textsubscript{2}O, and the filtrate was washed with 150 mL of water. The aqueous layer was back-extracted with several portions of Et\textsubscript{2}O (500 mL total) and the ethereal extracts were washed once with brine and dried over MgSO\textsubscript{4}. Filtration was followed by concentration under reduced pressure, and the crude brown residue was purified by silica gel chromatography (gradient elution, 0→30% EtOAc/Hexanes) to give 3.90 g (69% yield) of 58 as a white powder.

Preparation of alcohol 54.

In a 500 mL flask fitted with a CaCl$_2$ drying tube, CeCl$_3$•7H$_2$O (17.40 g, 46.80 mmol) was heated to 120 °C in vacuo for 12 h, then cooled to room temperature under N$_2$. The flask was quickly fitted with a septum, 50 mL of THF was added, and the resulting slurry was stirred vigorously for 1 hour at room temperature. A solution of ester 58 (3.90 g, 7.80 mmol) in 15 mL THF was added via cannula (rinsed with 5 mL THF) and the mixture was stirred for 30 min at room temperature before it was cooled to −40 °C. To the cooled solution was added 18.20 mL of MeMgBr (3.0 M solution in Et$_2$O, 54.6 mmol) and stirring was continued for 20 min at −40 °C followed by 10 min stirring at 0 °C. The reaction was poured into ice and diluted with Et$_2$O (200 mL). The aqueous layer was partitioned several times with Et$_2$O (500 mL total), and the combined Et$_2$O extracts were washed twice with saturated aqueous NaHCO$_3$, once with brine, and dried over MgSO$_4$. Filtration was followed by removal of solvent under reduced pressure, and the crude residue was purified by silica gel chromatography (gradient elution, 0→30% EtOAc/Hexanes) to give 3.75 g 54 (96% yield) as a white powder.

Preparation of chloro-ketone 56.

To a vigorously stirring solution of alcohol 54 (0.80 g, 1.60 mmol) dissolved in 80 mL MeCN and 14 mL CH₂Cl₂ was added CeCl₃·7H₂O (1.26 g, 3.52 mmol) while stirring in a flask open to air. The mixture was cooled to −5 °C and aqueous NaOCl (diluted to ~0.1 M from commercial Clorox® (~0.84M), 19.0 mL, 19.0 mmol) was added dropwise over 5 min. The reaction temperature was maintained at −5 °C for 30 min, after which time TLC indicated the reaction was not complete and additional NaOCl was added (2 x 7.0 mL, 14.0 mmol total) and stirring continued for 1½ h total. The reaction was quenched with saturated aqueous Na₂S₂O₃ and diluted with 150 mL EtOAc. The aqueous layer was partitioned with EtOAc (300 mL total), and the combined EtOAc extracts were washed once with saturated aqueous NaHCO₃, brine, and dried over MgSO₄. Filtration was followed by concentration under reduced pressure, and the residue was purified by silica gel chromatography (gradient elution, 0→30% EtOAc/Hexanes) to give 0.667 g (78% yield) of 56 as a white foam.

Preparation of ketone 60.

To a solution of TIPS ether 56 (1.2 g, 2.25 mmol) dissolved in 120 mL MeCN in a 250 mL plastic nalgene screw-top bottle was added 1.94 mL of aqueous H$_2$SiF$_6$ (~20% wt solution, 2.70 mmol). The bottle cap was screwed tight and the reaction mixture was heated to 65 °C for 10 h. To the cooled reaction was added 200 mL EtOAc, and 100 mL saturated aqueous NaHCO$_3$. The aqueous wash was partitioned several times with EtOAc (400 mL total), and the combined EtOAc extracts were washed with brine, dried over MgSO$_4$, filtered and concentrated under reduced pressure. The crude solid was routinely used without further purification, however analytically pure 60 could be obtained by silica gel chromatography (gradient elution, 1→6% MeOH/CH$_2$Cl$_2$).

**Preparation of diol 63.**

To a solution of Me$_4$NHB(OAc)$_3$ (4.16 g, 15.84 mmol) in 8 mL of MeCN was added 8 mL of glacial AcOH under $N_2$, and the resulting solution was stirred 30 min at room temperature, after which time it was added via cannula to a stirring suspension of crude ketone 60 (~2.25 mmol) dissolved in 8.0 mL MeCN. The reaction mixture was stirred for 3 h at room temperature then quenched by addition of 25 mL Rochelle’s salt solution and dilution with EtOAc. The resulting biphasic mixture was stirred vigorously for 1 hr before the aqueous layer was partitioned with a total of 400 mL EtOAc. The combined EtOAc extracts were rinsed once with saturated aqueous NaHCO$_3$, and the aqueous wash was back extracted with EtOAc (2 x 50 mL). The EtOAc extracts were washed once more with saturated aqueous NaHCO$_3$, once with brine
and dried over MgSO₄. Filtration was followed by concentration under reduced pressure, and the crude solid was purified by silica gel chromatography (gradient elution, 1→6% MeOH/CH₂Cl₂) to give 0.705g (82% yield over 2 steps) of 63 as a white powder. Solid 63 could be recrystallized from CDCl₃ to give crystals suitable for single crystal x-ray diffraction.

To a stirring suspension of diol 63 (230.0 mg, 0.605 mmol) in 4 mL of CH₂Cl₂ and 2 mL C₆H₆ under N₂ was added a solution of Martin sulfurane (1.22 g, 1.81 mmol) in 4 mL benzene (note: Martin sulfurane was weighed and stored in a glove box to preserve the integrity of the reagent). The resulting yellow solution was stirred 20 min at room temperature, and then quenched with 10 mL of 0.5 M NaOH. The aqueous layer was partitioned with 400 mL total of EtOAc, and the combined EtOAc extracts were washed once with brine, dried over MgSO₄, and concentrated under reduced pressure. The crude oil was purified by silica gel chromatography (gradient elution, 10→70% EtOAc/Hexanes) to give 180.0 mg (82% yield) of 64 as a fine white powder.

To a stirring solution of 64 (484 mg, 1.33 mmol) in 12 mL of CH$_2$Cl$_2$ was added Dess-Martin periodinane (1.35 g, 3.18 mmol) at room temperature. The resulting solution was stirred 1.5 h, after which time 12 mL saturated Na$_2$S$_2$O$_3$ was added and the mixture was stirred until both layers were clear. Saturated NaHCO$_3$ was added and the aqueous layers were partitioned with 400 mL total of CH$_2$Cl$_2$. The combined CH$_2$Cl$_2$ extracts were washed once with brine, dried over MgSO$_4$, and concentrated under reduced pressure. The crude solid was purified by silica gel chromatography (gradient elution, 10→40% EtOAc/Hexanes) to give 460 mg of 45 (95% yield) as a white powder.

Preparation of oxindole 11.

To a stirring solution of ketone 45 (35 mg, 0.097 mmol) in 0.7 mL THF under N₂ was added DBU (7 µL, 0.047 mmol). The resulting orange solution was stirred 4 h at room temperature, at which time TLC indicated complete conversion to the aniline. The solution was cooled to 0 °C and addition of Et₂N (82 µL, 0.584 mmol) was followed by phosgene addition (287 µL of ~20% soln in PhMe, 0.584 mmol). The mixture was warmed to room temperature over 30 min and concentrated in vacuo to approximately one third the original volume. The amine salts were suspended in dry Et₂O (2 mL), filtered in vacuo over Celite (mixture transferred to a fritted filter containing Celite fitted with a rubber septa via Teflon cannula), and rinsed with a total of 25 mL dry Et₂O. The filtrate was concentrated under reduced pressure, the residue was azeotroped with benzene (2 x 2 mL), and further dried in vacuo for 2 h. The yellow oil was dissolved in 0.5 mL THF, cooled to −78 °C while under N₂, and t-BuOH (9 µL, 0.097 mmol) was added. Meanwhile, in a separate flask, LiCl (65 mg, 1.55 mmol) was rapidly flame-dried in vacuo. Once cooled, freshly prepared SmI₂ (3.88 mL of ~0.1M soln, 0.388 mmol) was added rapidly and the resulting emerald green mixture was stirred 10 min under N₂ (note: SmCl₂ is only sparingly soluble in THF, therefore it should not be prepared and stored, but instead used immediately). The preformed mixture of SmI₂/LiCl was added dropwise via Teflon cannula to the cooled solution of the isocyanate and stirred 15 min at −78 °C. If the reaction was not complete, additional SmI₂/LiCl solution was added in 1 equivalent portions until TLC indicated no remaining isocyanate. The reaction was quenched by treating with O₂ at −78 °C followed by addition of saturated Na₂S₂O₃ and dilution with EtOAc. The aqueous layer was partitioned with of EtOAc (50 mL total), and the combined organic extracts were washed once with saturated Na₂S₂O₃, once with brine, dried over MgSO₄, filtered and concentrated under reduced pressure. The crude yellow oil was purified by silica gel chromatography (gradient elution, 10 → 30%
EtOAc/Hexanes) to give 25 mg of 11 (75% yield) as a white powder. Attempts to recrystallize from CH₂Cl₂/MeOH provided a single crystal suitable for x-ray diffraction.

Preparation of alcohol 71.

To a solution of ketone 11 (12.0 mg, 0.035 mmol) dissolved in THF (0.5 mL) was added MeOH (30.0 µL) and NaBH₄ (20 mg, 0.526 mmol). The reaction was stirred at room temperature for 1 h, after which time EtOAc (10 mL) was added followed by H₂O (5 mL). The aqueous layer was partitioned several times with EtOAc (50 mL) and the combined organic layers were washed once with brine and dried over MgSO₄. Filtration was followed by concentration under reduced pressure and silica gel chromatography (gradient elution, 0 → 30% EtOAc/benzene) to give pure 71 (10.0 mg, 83% yield) as a white powder.

Preparation of vinyl triflate 74.

To a solution of ketone 11 (9.0 mg, 0.026 mmol) in CH₂Cl₂ (1.0 mL) was added TBS chloride (80.0 mg, 0.52 mmol), Et₃N (91.0 µL, 0.65 mmol) and DMAP (0.5 mg, 0.004 mmol).
The flask was sealed with a glass stopper and heated to 40 °C in a sand bath overnight. The reaction was stopped by concentration under reduced pressure and the residue was purified by silica gel chromatography (gradient elution, 0 → 10% EtOAc/Hexanes) to give 10 mg (84% yield) of S5 as colorless oil. The N-TBS compound was not stable to storage, therefore it was immediately used in the subsequent step.

To a solution of S5 (10.0 mg, 0.022 mmol) in dry THF (1mL) cooled to –40 °C under N₂ was added LHMDS (1M solution in THF, 0.20 mL, 0.20 mmol). The reaction was stirred for 45 min at this temperature, after which time a solution of Comins’ reagent (78.0 mg, 0.20 mmol, solution in 0.3 mL THF) was added via canula. After stirring an additional 1 h at –40 °C, the reaction was quenched by addition of saturated aqueous NaHCO₃. The aqueous layer was partitioned with EtOAc (50 mL total) and the combined organic layers were washed once with brine and concentrated under reduced pressure. The residue was taken up in THF (1 mL) and 1M HCl was added (0.1 mL). The reaction was stirred for 20 min, then partitioned with EtOAc (50 mL total). The combined organic layers were washed once with saturated aqueous NaHCO₃ and dried over MgSO₄. Filtration followed by concentration under reduced pressure and silica gel chromatography provided 74 (7 mg, 67 % yield) as a white powder.

**Preparation of ketone 80.**
To a suspension of diol 63 (352.0 mg, 0.926 mmol) in CH₂Cl₂ (20 mL) under N₂ was added 2,6 lutidine (1.08 mL, 9.26 mmol) followed by TBSOTf (1.77 mL, 2.32 mmol) at room temperature. The reaction was stirred 30 min, then quenched by addition of 1M HCl (10 mL). The aqueous layer was partitioned with CH₂Cl₂ (150 mL total) and the combined organic layers were washed once more with 1 M HCl (20 mL), once with saturated aqueous NaHCO₃ (20 mL), once with brine (20 mL) and dried over MgSO₄. Filtration was followed by concentration under reduced pressure and silica gel chromatography (10 → 30% EtOAc/Hexanes) to give pure S6 (438.0 mg, 96% yield) as a colorless oil.

To a solution of silyl ether S6 (438 mg, 0.890 mmol) dissolved in CH₂Cl₂ (10 mL) was added DMP (1.24 g, 2.67 mmol). The reaction was stirred at room temperature for 2 h then quenched by addition of saturated sodium thiosulfate, diluted with 10 mL CH₂Cl₂, and vigorously stirred until both layers were clear. Saturated aqueous NaHCO₃ was added, the aqueous layer was partitioned with CH₂Cl₂ (200 mL total), and the combined organic extracts were dried over MgSO₄. Filtration was followed by concentration under reduced pressure and silica gel chromatography (gradient elution, 0 → 30 % EtOAc/Hexanes) to give 80 (325 mg, 74% yield, 71% yield over 2 steps from 63) as a white powder.

Preparation of oxindole 81.
To a solution of ketone 80 (22.0 mg, 0.045 mmol) in THF (0.5 mL) was added DBU (7.0 µL, 0.040 mmol) and the resulting yellow-orange solution was stirred for 8 h at room temperature, after which time TLC indicated consumption of the starting material. The solution was cooled to 0 °C and Et₃N (63.0 µL, 0.450 mmol) and phosgene (~20% solution in PhMe, 0.22 mL, 0.450 mmol) were sequentially added. The reaction was stirred 30 min at 0 °C then warmed to room temperature and concentrated to one half the volume in vacuo. Upon dilution with dry Et₂O, the Et₃N salts were removed by filtration over Celite and rinsed with dry Et₂O (20 mL total). The solvent was removed under reduced pressure and the residue was dried in vacuo for 2 h. The dry residue was taken up in 1 mL of dry THF, cooled to −78 °C, and t-BuOH was added (0.5 M solution in THF, 90 µL, 0.045 mmol).

In a separate flask, LiCl (61 mg, 1.44 mmol) was quickly flame-dried in vacuo. Upon cooling, SmI₂ (0.10 M solution in THF, 1.8 mL, 0.18 mmol) was added under N₂ and the resulting green mixture was vigorously stirred at room temperature. After 10 min, the green mixture was added via canula to the THF solution of the isocyanate. After stirring 20 min, TLC indicated remaining isocyanate. A second portion of SmI₂/LiCl was prepared as before (61 mg LiCl, 1.8 mL SmI₂) and added via canula and the reaction was stirred 20 min longer at −78 °C. The reaction was quenched by addition of aqueous saturated NH₄Cl and diluted with EtOAc. The aqueous layer was partitioned with EtOAc (100 mL total) and the combined organic extracts were washed once with saturated aqueous Na₂S₂O₃, once with brine, and dried over MgSO₄. Filtration was followed by concentration under reduced pressure, and the crude residue was purified by silica gel chromatography (gradient elution, 10 → 30% EtOAc/Hexanes) to give pure 81 (19 mg, 89 % yield) as a white powder.

**Preparation of phthalimide 97.**

To a flask containing alcohol 93 (44.0 mg, 0.076 mmol), PPh_3 (75.0 mg, 0.285 mmol) and N-hydroxyphthalimide (62.0 mg, 0.380 mmol) under N_2 was added dry THF (2 mL) followed by DIAD (56.0 µL, 0.285 mmol). The reaction immediately turned a dark orange/red color, which gradually faded over 30 min to a colorless solution. The reaction was quenched after 45 min at room temperature by addition of saturated aqueous NaHCO_3. The aqueous layer was partitioned with EtOAc (50 mL total), and the combined organic extracts were washed once with brine and dried over MgSO_4. Filtration was followed by concentration under reduced pressure and the crude residue was purified by silica gel chromatography (gradient elution, 20 → 50% EtOAc/Hexanes) to give 96 as a white foam which was contaminated with a DIAD biproduct (total mass: 60 mg). This material was used as is in the following step.

To a solution of impure 96 (60 mg including impurity) in CH_2Cl_2 (2 mL) was added TFA (1 mL) and the reaction was stirred at room temperature. After 3 hours the reaction was concentrated under reduced pressure and the crude residue was purified by silica gel chromatography (10 → 50% EtOAc/Hexanes) to give pure 97 as a white powder (33.0 mg, 83% yield over 2 steps).

Preparation of oxime 103.

To a solution of phthalimide 97 (33.0 mg, 0.062 mmol) in CHCl₃ (2.0 mL) was added hydrazine hydrate (50.0 µL, 1.60 mmol) and the reaction was stirred 20 min at room temperature. After this time, white precipitate had formed and the reaction was concentrated under reduced pressure. The crude residue was taken up in acetone (1.0 mL) and pyridine (10.0 µL, 0.124 mmol) was added. The mixture was stirred 30 min, then diluted with CH₂Cl₂ and filtered through celite. The filtrate was concentrated under reduced pressure and the crude residue was purified by silica gel chromatography (gradient elution, 20 → 60% EtOAc/Hexanes) to give pure 103 (25.0 mg, 93% yield) as a white powder.

Preparation of oxindole 106.

To a solution of oxime 104 (20.0 mg, 0.046 mmol) in THF (1.0 mL) was added DBU (6.0 µL, 0.041 mmol) and the reaction was stirred at room temperature for 5 h. After this time, the
orange solution was cooled to 0 °C and DIPEA (80.0 µL, 0.46 mmol) and phosgene (~20% solution in PhMe, 0.242 mL, 0.46 mmol) were added sequentially. After stirring 20 min at 0 °C, the mixture was warmed to room temperature, concentrated to half the volume in vacuo and then diluted with dry Et₂O (5.0 mL). The amine salts were filtered over Celite and washed thoroughly with dry Et₂O (20 mL total), and the filtrate was concentrated under reduced pressure then dried in vacuo for 2 h.

In a separate flask, LiCl (42.0 mg, 1.00 mmol) was quickly flame-dried in vacuo. Upon cooling, SmI₂ (0.1 M solution in THF, 2.50 mL, 0.250 mmol) was added and the emerald green mixture was rapidly stirred under N₂ for 10 min. Separately, the crude isocyanate residue was dissolved in dry THF (1.0 mL), cooled to −78 °C under N₂, and t-BuOH (4.4 µL, 0.046 mmol) was added. To the cooled solution was then added the preformed SmI₂/LiCl mixture (1.84 mL, 0.184 mmol) via syringe. After 15 min, TLC indicated isocyanate still remained so a second flask of SmI₂/LiCl mixture was prepared as above, of which an additional 1.84 mL (0.184 mmol) was added via syringe to the reaction mixture. The reaction was stirred 15 min longer, then quenched by addition of saturated aqueous NH₄Cl. The aqueous layer was partitioned with EtOAc (40 mL total) and the combined organic extracts were washed once with saturated aqueous Na₂S₂O₃, once with brine, and dried over MgSO₄. Filtration followed by concentration under reduced pressure and silica gel chromatography (gradient elution, 10 → 30% EtOAc/Hexanes) provided pure 106 (15.0 mg, 78% yield) as a white solid.

Preparation of oxazine 89.

To a glass microwave vessel containing 106 (8.0 mg, 0.019 mmol), HONH$_2$HCl (27.0 mg, 0.384 mmol), and NaOAc (32.0 mg, 0.384 mmol) was added MeOH (0.8 mL) and H$_2$O (0.1 mL). The vessel was equipped with a stirbar, sealed, and heated to 75 °C (30 sec pre-stirring, “very high” irradiation setting) for 2 ½ h. After this time, the mixture was transferred to a flask and concentrated under reduced pressure. The residue was dissolved in EtOAc (5 mL) and H$_2$O was added (3 mL). The aqueous layer was partitioned several times with EtOAc (30 mL total), and the combined organic extracts were washed once with brine and dried over MgSO$_4$. Filtration was followed by concentration under reduced pressure and silica gel chromatography (gradient elution, 10 → 30% EtOAc/Hexanes) to give pure 89 (6.0 mg, 87% yield) as a white film.

Preparation of hydroxy quinoline 119.
To a solution of ketone 45 (2.0 mg, 0.006 mmol) in THF (0.3 mL) was added DBU (1 µL, 0.006 mmol) and the reaction was stirred at room temperature for 4 h. The yellow reaction was concentrated under reduced pressure, and DMAP (0.5 mg, 0.004 mmol) followed by CH₂Cl₂ (0.4 mL), Et₃N (10.0 µL, 0.071 mmol) and MeO₂CCl (5.0 µL, 0.065 mmol) were added. Upon addition of the CH₂Cl₂, the yellow color immediately faded. After 10 minutes, TLC indicated that the starting material had been consumed and the reaction was concentrated under reduced pressure and the residue was purified by silica gel chromatography (gradient elution 10 → 30% EtOAc/Hexanes) to provide 119 (1.0 mg, 64% yield) as a pale yellow oil.

To a stirring suspension of 45 (140 mg, 0.389 mmol) in 3 mL of CH₂Cl₂ under N₂ was added (Boc)₂O (100 µL, 0.428 mmol) followed by sequential addition of DMAP (2 mg, 0.016 mmol) and Et₃N (0.272 mL, 1.94 mmol). The resulting yellow solution was stirred 30 min, at which time TLC indicated consumption of starting material and DBU (33 µL, 0.194 mmol) was added. Stirring was continued at room temperature for 3 h, then the reaction was diluted with CH₂Cl₂ and 10 mL of H₂O was added. The aqueous layer was partitioned with a total of 60
mL CH₂Cl₂, and the combined CH₂Cl₂ extracts were washed once with brine, dried over MgSO₄, and concentrated under reduced pressure. The crude orange oil was purified by silica gel chromatography (gradient elution, 0→30% Et₂O/Hexanes) to give 150 mg (92% yield) of 121 as a yellow oil.

Preparation of methoxyl amine 125.

To a solution of 124 (58.0 mg, 0.131 mmol) in 1 mL DCE under N₂ was added glacial AcOH (80.0 µL, 1.31 mmol) followed by NaBH₃CN (83.0 mg, 1.31 mmol). After 1 hr of stirring at room temperature, additional NaBH₃CN (10.0 mg, 0.159 mmol) and AcOH (10.0 µL, 0.167 mmol) were added and the mixture was stirred one additional hour. The reaction was quenched with H₂O and diluted with EtOAc. The aqueous layer was partitioned with a total of 50 mL EtOAc and the combined organic layers were washed once with saturated aqueous NaHCO₃, once with brine, and dried over MgSO₄. Filtration was followed by removal of the solvent under reduced pressure, and the crude colorless oil was purified by silica gel chromatography (gradient elution, 0→20% Et₂O/Hexanes) to give 47.0 mg (80% yield) of 125 as a white foam. Note: this material is used immediately in the next step as it is unstable to long term storage.

Preparation of methoxyamide 126.

To a solution of 125 (54.0 mg, 0.121 mmol) in 6 mL of CH$_2$Cl$_2$ at under N$_2$ was added 100.0 µL of acetic formic anhydride (prepared from heating 0.4 mL HCOOH and 0.8 mL of (CH$_3$CO)$_2$O to 65 °C for 45 min under N$_2$). The resulting solution was stirred for 1 hour at room temperature, then concentrated under reduced pressure. The residue was purified by silica gel chromatography (gradient elution, 0→30% EtOAc/Hexanes) to give 56.0 mg (98% yield) of 126 as a colorless oil. $^1$H NMR spectra shows two sets of broad peaks for 126 due to rotamers (see attached spectra). The material was generally used immediately in the subsequent reaction.

Preparation of formamide S6.

To a solution of 126 (58.0 mg, 0.127 mmol) in 0.5 mL of THF under N$_2$ was added SmI$_2$ (~0.1 M solution in THF, 3.0 mL, 0.30 mmol) at room temperature. After stirring 15 min, the deep blue solution turned yellow, however TLC indicated remaining starting material. Three additional 3.0 mL portions of SmI$_2$ solution (1.20 mmol total, ~10 equivalents) were added over 1 hour, at which time TLC indicated complete conversion. The reaction was quenched by addition of saturated aqueous Na$_2$S$_2$O$_3$ and diluted with EtOAc. The aqueous layer was partitioned with a total of 75 mL of EtOAc, and the combined EtOAc extracts were washed once with brine, dried over MgSO$_4$, filtered and concentrated under reduced pressure. The crude oil
was purified by silica gel chromatography (gradient elution, 10→30% EtOAc/Hexanes) to give 52.0 mg of S7 (92% yield) as a colorless oil.

Preparation of formamide 127.

To a solution of 22.0 mg of S7 (0.050 mmol) in 0.2 mL of THF was added 0.8 mL of formic acid. The resulting solution was stirred 6 h at room temperature, after which time the solvent was removed under reduced pressure. The residue was purified by silica gel chromatography (gradient elution, 10→50% EtOAc/Hexanes) to give 13.5 mg (79% yield) of 127 as a colorless oil.

Preparation of (±)-welwitindolinone A isonitrile (1).

A solution of 127 (3.0 mg, 0.0087 mmol) dissolved in 0.3 mL CH₂Cl₂ under N₂ was cooled to 0 °C and Et₃N (8 µL, 0.052 mmol) was added followed by COCl₂ (20% solution in
toluene, 23.0 µL, 0.044 mmol). The reaction was warmed to room temperature, concentrated under reduced pressure, then diluted with dry Et₂O. The triethylamine salts were removed by filtration under nitrogen, rinsed several times with dry Et₂O (20 mL total), and the filtrate was concentrated under reduced pressure. The residue was azeotroped with benzene (2 x 1 mL) and dried in vacuo for 3 h. Meanwhile, a separate flame dried flask was charged with 90.0 mg of solid LHMDS in a glovebox. The flask was capped with a septum, removed from the glovebox, and 0.50 mL of dry THF was added under N₂ to give a 1.08 M solution. The crude isocyanate was dissolved in dry THF while under N₂, cooled to −78 °C and LHMDS (44.0 µL, 0.044 mmol) was added. After 15 min, the reaction was quenched with water and diluted with EtOAc. The aqueous layer was partitioned several times with EtOAc (30 mL), and the combined EtOAc extracts were dried over MgSO₄. Filtration was followed by removal of the solvent under reduced pressure, and the crude residue was purified by silica gel chromatography (gradient elution, 0→20% Et₂O/benzene) to give 1.4 mg (47% yield) of 1 as a yellow oil.
