**General Experimental Procedures**

All starting amino acids and reagents used are commercially available, unless referenced to synthetic procedure. Dichloromethane was distilled from calcium hydride under nitrogen, and tetrahydrofuran was distilled from sodium under argon. Analytical thin-layer chromatography (TLC) was carried out on F$_{254}$ 250-µm silica gel plates, and visualized by UV lamp. $^1$H NMR spectra were acquired on a Bruker Avance (DPX) 400 MHz spectrometer or Varian Mercury 300 MHz spectrometer. $^{31}$P NMR spectra were acquired on a Varian Mercury 300 MHz spectrometer. $^{31}$C NMR spectra were acquired on a Varian Inova 500 MHz spectrometer or a Bruker Avance (DPX) 400 MHz spectrometer. Chemical shifts are reported in ppm from a standard (tetramethylsilane for $^1$H, H$_2$PO$_4$ for $^{31}$P, CDCl$_3$ for $^{13}$C), and $J$ values are in Hertz. High-resolution mass spectrometry was performed on a Fourier Transform Mass Spectrometer using an Electrospray Ion Source. High-performance liquid chromatography (HPLC) was performed using a Waters 600E HPLC fitted with a Waters 600 automated control module and a Waters 2487 dual wavelength absorbance detector recording at 228 and 280 nm. For analytical HPLC a Beckman Ultrasphere C$_{18}$, 5 µm, 4.6 x 150 mm reverse-phase column was used. For preparative separations a YMC-pack, C$_{18}$, 250 x 20 mm reversed phase column was used. The standard gradient for analytical and preparatory HPLC used was 93:7 to 0:100 over 35 minutes (water:acetonitrile, 0.1% TFA). Electrospray Ionization Mass Spectrometry (ESI-MS) was performed on a PerSeptive Biosystems Mariner™ Biospectrometry Workstation (Turbo Ion Source). All tRNAs were analyzed on a PerSeptive Biosystems (Framingham, MA) Voyager DE PRO MALDI-TOF mass spectrometer operating in linear and positive ion modes with settings as previously described.$^1$
**Chemical Synthesis**

**O-1-(2-nitrophenyl)ethyl-O’-tert-butyln,N,N-diethyl phosphoramidite (3).** To an oven dried flask with stir bar, hexaethyl phosphorus triamide (1.37 mL, 5.00 mmole) and 4,5-dicyanoimidazole (0.58 g, 4.90 mmole) are dissolved in anhydrous tetrahydrofuran (THF, 15 mL) under inert atmosphere. In an oven dried pear flask, tert-Butyl alcohol (0.48 mL, 5.00 mmole) was dissolved in anhydrous THF (5.0 mL). In a separate oven dried pear flask, 1-2-(nitrophenyl)ethyl alcohol (1.00 g, 6.00 mmole) was dissolved in anhydrous THF (1 mL). The BuOH solution was delivered to the phosphoramidite mixture via cannula, and the reaction allowed to stir at room temperature for 15 minutes, at which point, the nitrophenylethyl alcohol mixture was delivered to the reaction flask via cannula. The mixture was allowed to stir overnight, in the dark, at room temperature. The mixture was then concentrated under reduced pressure, and redissolved in ethyl acetate (EtOAc, 150 mL). The organic solution was washed with 20 % sodium bicarbonate (NaHCO₃, 2 x 150 mL) and brine (1 x 150 mL), then dried over magnesium sulfate (MgSO₄), filtered, and concentrated. The final product was purified by silica gel flash chromatography (98:2 Hexanes/triethylamine (NEt₃), Rf: 0.73) to give 5 (1.27 g) in 74.0 % yield. ¹H NMR (300 MHz, CDCl₃) δ ppm: 7.92 (td, J₉H = 1.8 Hz, J₉₂H = 8.4 Hz, 2H), 7.65 (tt, J₂H = 1.5 Hz, J₂₂H = 7.5, 1H), 7.40, (tt, J₂H = 1.5 Hz, J₂₂H = 8.4 Hz, 1H), 5.55 (m, 1 H), 3.06 (m, 4H), 1.57 (dd, J₉H = 4.5 Hz, J₉₂H = 6.3 Hz, 3H), 1.30 (d, J₉H = 19.5 Hz, 9H), 1.08 (dt, J₉H = 6.0 Hz, J₉₃H = 43.5 Hz, 6 H). ³¹P NMR (121.5 MHz, CDCl₃) δ ppm: 139.93, 139.16 (racemic mixture). ¹³C NMR (125.8 MHz, CDCl₃) 147.9, 142.0, 133.8, 129.6, 128.2, 124.5, 75.5, 67.0, 38.3, 31.3, 25.9, 15.6. Product is not stable to MS measurements.

**N⁷⁴-pentenoyl-O-tert-butyln-L-Serine:** H-O-tert-butyln-L-Serine (1a, 500 mg, 3.10 mmole) and N,N-disopropylethylamine (DIPEA, 663 µL, 3.70 mmole) were dissolved in THF (30 mL) and water (30 mL). 4-pentenoic anhydride (676 µL, 3.70 mmole) was dissolved in THF (2 mL), and added to the serine solution. The reaction was monitored by TLC (1:1:0.01 hexanes/EtOAc/acetic acid (AcOH), Rf = 0.30), stained with iodine and ninhydrin. After the disappearance of starting material, the THF was removed under reduced pressure, and the water layer extracted with EtOAc (3 x 100 mL). The organic portions were dried over MgSO₄, filtered and concentrated under reduced pressure. The product was purified by silica gel flash chromatography (827 mg) in 93.7 % yield. ¹H NMR (300 MHz, CDCl₃) δ ppm: 6.99 (d, J₉H = 8.1 Hz, 1 H), 5.70 (m, 1 H), 4.94 (q, J₉H = 17.1, 10.2, 10.2 Hz, 2 H), 4.64 (m, 1 H), 3.71 (dd, J₉H = 9 Hz, J₉₂H = 3 Hz, 1 H), 3.46 (dd, J₉H = 9.3 Hz, J₉₂H = 3 Hz, 1 H), 2.25 (s, 4 H), 0.99 (s, 9 H). ¹³C NMR (125.8 MHz, CDCl₃) δ ppm: 176.0, 173.9, 136.7, 115.8, 73.7, 61.9, 53.0, 35.3, 29.7, 27.3. ESI-MS: [M-H]⁺ 242.1401 (obsd), 242.1398 (calcd).

**N⁷⁴-pentenoyl-O-tert-butyln-L-Serine cyanomethyl ester:** N⁷⁴-pentenoyl-O-tert-butyln-L-Serine (825 mg, 3.39 mmole) was dissolved in chloroacetonitrile (644 µL, 10.20 mmole), and cooled to 0°C, stirring, under argon. Diazabicyclo[5.4.0]undec-7-ene (DBU, 507 µL, 3.39 mmole) was slowly added to the stirring mixture. The reaction was allowed to warm to room temperature, and stir overnight under argon. The reaction mixture was diluted with EtOAc (150 mL), washed with water (2 x 150 mL), then brine (1 x 150 mL), dried over MgSO₄, filtered and concentrated (1:1 hexanes/EtOAc, Rf = 0.41) (765 mg, 79.9 %). ¹H NMR (300 MHz, CDCl₃) δ ppm: 6.81 (d, J₉H = 8.7 Hz, 1 H), 5.83 (m, 1 H), 5.11 (q, J₉H = 18.3, 6.6, 9.9 Hz, 2 H), 4.84 (m, 3 H), 3.86 (dd, J₉H = 9.3 Hz, J₉₃H = 3.3 Hz, 1 H), 3.58 (dd, J₉H = 9.3 Hz, J₉₃H = 3.3, 1 H), 2.38 (s, 4 H), 1.16 (s, 9 H). ¹³C NMR (125.8 MHz, CDCl₃) δ ppm: 172.7, 169.6, 137.1, 115.7, 114.5, 73.8, 61.9, 52.7, 49.2, 35.2, 29.5, 27.3. ESI-MS: [MNa]⁺ 305.1478 (obsd), 305,1472 (calcd).

**N⁷⁴-pentenoyl-L-Serine cyanomethyl ester (2a):** N⁷⁴-pentenoyl-O-tert-butyln-L-Serine cyanomethyl ester (750 mg, 2.69 mmole) was dissolved in an ice-cold solution of triflouroacetic acid (TFA) with 1 % (v/v) trisopropylsilane (TIS). The reaction was stirred at 0°C for 4 hours, and determined complete by TLC (EtOAc, Rf = 0.43). The reaction mixture was poured into ice-cold saturated NaHCO₃ (250 mL) and EtOAc (120 mL). The organic layer was washed with saturated NaHCO₃ (3 x 100 mL), then brine (1 x 100 mL), dried over MgSO₄, filtered, and concentrated under reduced pressure. The mixture was purified by silica gel flash chromatography to give the product (156 mg) in 25.6 % yield. ¹H NMR (300 MHz, CDCl₃) δ ppm: 6.90 (d, J₉H = 7.8 Hz, 1 H), 5.87 (m, 1 H), 5.10 (t, J₉H = 19.5, 10.8 Hz, 2 H), 4.80 (d, J₉H = 1.5 Hz, 3 H), 4.70 (m, 1 H), 4.06 (dd, J₉H = 11.7 Hz, J₉₃H = 3.6, 3.3 Hz, 1 H), 3.87 (dd, J₉H = 11.4 Hz, J₉₃H = 3.6, 3.6 Hz, 1 H), 2.38 (d, J₉H = 3.0 Hz, 4 H). ¹³C NMR (125.8 MHz, CDCl₃) δ ppm: 173.5, 169.8, 137.0, 116.4, 114.5, 63.0, 54.6, 49.7, 35.8, 29.8. ESI-MS: [MNa]⁺ 249.0847 (obsd), 249.0846 (calcd).
N\textsuperscript{\alpha}-4-pentenoyl-phospho(1-nitrophenylethyl-2-tert-butyl)-L-Serine cyanomethyl ester (4a): N\textsuperscript{\alpha}-4-pentenoyl-L-Serine cyanomethyl ester (2a, 150 mg, 663 \mu mol) was dissolved in anhydrous THF (2.0 mL), in a round bottom flask fitted with an oven dried stir bar under argon. In a separate pear flask, \textit{O}-1-(2-nitrophenylethyl)-\textit{O}’-tertbutyl-\textit{N},\textit{N}-diethyl phosphoramide (3, 340 mg, 995 \mu mol) and 4,5-dicyanomimidazole (157 mg, 1.33 mmol) were dissolved in anhydrous THF (1.3 mL) and kept dark. The phosphoramidite solution was delivered to the serine solution via syringe, and the reaction was allowed to stir overnight, under argon, in the dark. The reaction was judged complete by loss of starting material by TLC. The mixture was concentrated under reduced pressure, and redissolved in EtOAc (50 mL). The organic layer was washed with 10 \% NaHCO\textsubscript{3} (2 x 80 mL), brine (1 x 80 mL), then dried over sodium sulfate (Na\textsubscript{2}SO\textsubscript{4}), decanted and concentrated. The phosphite mixture was then oxidized with tert-butyl hydroperoxide (-BuOOH, 266 \mu L of 5 M solution in decane, 1.33 mmol) in dichloromethane (CH\textsubscript{2}Cl\textsubscript{2}, 10 mL) for one hour, in the dark. The mixture was diluted with CH\textsubscript{2}Cl\textsubscript{2} (50 mL), and washed with 10 \% NaHCO\textsubscript{3} (2 x 80 mL) and brine (1 x 80 mL), then dried over MgSO\textsubscript{4}, filtered and concentrated. The product was partially purified by silica gel flash chromatography (1:2 hex/EtOAc, \textit{R} = 0.26), and carried on to the next step before final purification (68.2 \%).

N\textsuperscript{\alpha}-4-pentenoyl-phospho(1-nitrophenylethyl-2-tert-butyl)-L-Serine cyanomethyl ester (5a): N\textsuperscript{\alpha}-4-pentenoyl-phospho(1-nitrophenylethyl-2-tert-butyl)-L-Serine cyanomethyl ester (4a, 69 mg, 135 \mu mol) was dissolved in acetonitrile (MeCN, 4.0 mL) at room temperature, stirring, and kept dark. A solution of TFA (1.0 mL) with TIS (50 \mu L) was added to the solution, and stirred for 10 minutes at room temperature. The mixture was then poured into ice-cold saturated NaHCO\textsubscript{3} (4.0 mL). The product mixture was purified by reversed phase HPLC. (93.7 to 0:100 water/MeCN/0.1 \% TFA, over 35 minutes, \textit{R} = 22.68 min) in 99 \% yield (61.0 mg). \textsuperscript{1}H NMR (300 MHz, CDCl\textsubscript{3}) \delta ppm: 8.00 (ddd, \textit{J} = 8.1 Hz, \textit{J} = 3.6, 3.6 Hz, \textit{J} = 1.5, 1.2, 1.5 Hz, 1 H), 7.79 (m, 2 H), 7.53 (m, 1 H), 6.04 (m, 1 H), 5.86 (m, 1 H), 5.11 (m, 2 H), 4.88 (m, 3 H), 4.40 (m, 3 H), 2.40 (dd, \textit{J} = 7.5 Hz, 4 H), 1.71 (dd, \textit{J} = 6.3 Hz, \textit{J} = 1.2, 1.2 Hz, 3 H). \textsuperscript{13}C NMR (125.8 MHz, CDCl\textsubscript{3}) \delta ppm: 173.7, 168.3, 147.3, 137.5, 137.0, 134.6, 129.5, 128.2, 125.0, 116.3, 114.2, 73.3, 67.2, 52.8, 50.1, 35.5, 29.7, 24.7. \textsuperscript{31}P (121.5 MHz, CDCl\textsubscript{3}) -1.382. ESI-MS: [M-H] + 454.1017 (obsd), 454.1021 (calcd).

N\textsuperscript{\alpha}-4-pentenoyl-O-tert-butyl-L-Threonine: H-O-tert-butyl-L-Threonine (1b, 500 mg, 2.85 mmole) and DIPEA (683 \mu L, 3.99 mmole) were dissolved in THF (40 mL) and water (10 mL). 4-pentenoic anhydride (730 \mu L, 3.99 mmole) was dissolved in THF (5 mL), and added to the threonine solution. The reaction was monitored by TLC (1:1:0.01 hexanes/EtOAc/AcOH, \textit{R} = 0.31), stained with iodine and ninhydrin. After the disappearance of starting material, the mixture was concentrated under reduced pressure, and the product was purified by silica gel flash chromatography (625 mg, 85.3 \%). \textsuperscript{1}H NMR (300 MHz, CDCl\textsubscript{3}) \delta ppm: 6.74 (d, \textit{J} = 8.4 Hz, 1 H), 5.88 (m, 1 H), 5.12 (q, \textit{J} = 17.4, 8.1, 10.2 Hz, 2 H), 4.60 (dd, \textit{J} = 8.7 Hz, \textit{J} = 2.7, 2.4 Hz, 1 H), 4.32 (m, 1 H), 2.43 (m, 4 H), 1.20 (s, 9 H), 1.71 (d, \textit{J} = 6.6 Hz, 3 H). \textsuperscript{13}C NMR (125.8 MHz, CDCl\textsubscript{3}) \delta ppm: 174.3, 174.0, 136.9, 116.0, 75.2, 67.2, 57.7, 35.6, 29.7, 28.4, 20.1. ESI-MS: [M-H] - 256.1551 (obsd), 256.1554 (calcd).

N\textsuperscript{\alpha}-4-pentenoyl-O-tert-butyl-L-Threonine cyanomethyl ester: N\textsuperscript{\alpha}-4-pentenoyl-O-tert-butyl-L-Threonine (390 mg, 1.51 mmol) was dissolved in chloroacetonitrile (478 \mu L, 7.55 mmole) and cooled to 0°C, stirring, under argon. DBU (226 \mu L, 1.51 mmole) was slowly added to the stirring mixture. The reaction was allowed to warm to room temperature, and stir overnight under argon. The reaction mixture was diluted with EtOAc (100 mL), washed with water (2 x 100 mL) and brine (1 x 100 mL), then dried over MgSO\textsubscript{4}, filtered and concentrated (1:1 hexanes/EtOAc, \textit{R} = 0.43) (321 mg, 71.7 \%). \textsuperscript{1}H NMR (300 MHz, CDCl\textsubscript{3}) \delta ppm: 6.39 (d, \textit{J} = 9.0 Hz, 1 H), 5.91 (m, 1 H), 5.14 (q, \textit{J} = 17.1, 7.5, 10.2 Hz, 2 H), 4.78 (d, \textit{J} = 3.0 Hz, 2 H), 4.61 (dd, \textit{J} = 9.3 Hz, \textit{J} = 2.1, 1.8 Hz, 1 H), 4.27 (m, 1 H), 2.42 (d, \textit{J} = 2.7 Hz, 4 H), 1.21 (d, \textit{J} = 6.3 Hz, 3 H), 1.14 (s, 9H). \textsuperscript{13}C NMR (125.8 MHz, CDCl\textsubscript{3}) \delta ppm: 173.1, 169.9, 137.1, 115.9, 114.3, 74.5, 67.2, 57.7, 49.1, 35.5, 29.5, 28.6, 21.0. ESI-MS: [MNa]\textsuperscript{+} 319.1617 (obsd), 319.1628 (calcd).

N\textsuperscript{\alpha}-4-pentenoyl-L-Threonine cyanomethyl ester (2b): N\textsuperscript{\alpha}-4-pentenoyl-O-tert-butyl-L-Threonine cyanomethyl ester (315 mg, 1.06 mmole) was dissolved in an ice-cold solution of TFA with 1 \% (v/v) TIS. The reaction was stirred at 0°C for two hours, and determined complete by TLC (1:1 hex/EtOAc, \textit{R} = 0.15). The reaction mixture was poured into ice-cold saturated NaHCO\textsubscript{3} (80 mL) and EtOAc (80 mL). The organic layer was washed with saturated NaHCO\textsubscript{3} (2 x 80 mL) and brine (1 x 80 mL), then dried over MgSO\textsubscript{4}, filtered, and concentrated under reduced pressure. The mixture was purified by silica gel flash chromatography to give the product (150 mg) in 59.0 \% yield. \textsuperscript{1}H NMR (300 MHz, CDCl\textsubscript{3}) \delta ppm: 6.39 (d, \textit{J} = 8.4 Hz, 1 H), 5.90 (m, 1 H), 5.14 (t, \textit{J} = 17.4, 13.8 Hz,
2 H), 4.87 (q, \( J_{HH} = 15.6, 7.5, 15.6 \text{ Hz}, 2 \text{ H} \)), 4.69 (dd, \( J_{HH} = 9.0 \text{ Hz}, J_{HH} = 2.7, 2.4 \text{ Hz}, 1 \text{ H} \)), 4.46 (qd, \( J_{HH} = 6.3, 6.3, 6.3 \text{ Hz}, J_{HH} = 2.4, 2.4, 2.4 \text{ Hz}, 1 \text{ H} \)), 2.43 (d, \( J_{HH} = 2.7 \text{ Hz}, 4 \text{ H} \)), 1.27 (t, \( J_{HH} = 4.2, 2.1 \text{ Hz}, 3 \text{ H} \)). \(^{13}\text{C} \text{ NMR} (125.8 \text{ MHz}, \text{CDCl}_3) \delta \text{ ppm}: 173.7, 170.2, 137.1, 116.4, 114.5, 68.0, 57.5, 49.6, 36.0, 29.8, 20.6. \text{ESI-MS}: [\text{MNa}^+] 263.1005 (obsd), 263.1002 (calcd).

\(N^4\)-4-pentenoyl-phospho(1-nitrophenylethyl-2-tert-buty1)-L-Threonine cyanomethyl ester (4b): \(^{11}\text{B} \text{ NMR} (300 \text{ MHz}, \text{CDCl}_3) \delta \text{ ppm}: 8.00 (d, \( J_{HH} = 7.2, 9.0 \text{ Hz}, 1 \text{ H} \)), 6.53 (bs, 1 \text{ H} \)), 6.05 (m, 1 \text{ H} \)), 5.87 (m, 1 \text{ H} \)), 6.30 (m, 2 \text{ H} \)), 4.92 (m, 6 \text{ H} \)), 4.22 (d, \( J_{HH} = 2.1 \text{ Hz}, 4 \text{ H} \)), 1.35 (dd, \( J_{HH} = 24.0 \text{ Hz}, J_{HH} = 6.3, 6.66 \text{ Hz}, 3 \text{ H} \)). \(^{13}\text{C} \text{ NMR} (125.8 \text{ MHz}, \text{CDCl}_3) \delta \text{ ppm}: 174.8, 169.1, 147.8, 137.6, 137.0, 134.7, 129.8, 128.5, 125.2, 116.8, 114.5, 75.8, 73.7, 56.6, 50.5, 35.9, 30.1, 24.9, 19.2. \(^{31}\text{P} (125.1 \text{ MHz}, \text{CDCl}_3): -1.13, -1.17. \text{ESI-MS}: [\text{M-H}]^- 468.1168 (obsd), 468.1177 (calcd).
7.36-7.45 (m, 1H), 7.55-7.73 (m, 2H), 7.89 (d, 1H, J_HH = 8.2 Hz). 13C-NMR (100.6 MHz, CDCl3, δ): 171.9, 170.5, 148.8, 146.6, 136.8, 133.9, 130.8, 128.9, 127.5, 124.4, 119.6, 119.5, 115.4, 82.2, 77.4, 73.6, 62.5, 53.3, 37.1, 35.2, 29.3, 27.8, 24.1, 24.0, 19.4. ESI-MS: [M+H]+ 602.1304 (obsd), 602.2267 (calcld).

N^4-4-pentenoyl-phospho(1-nitrophenylethyl)-L-Tyrosine tert-butyl ester: N^4-4-pentenoyl-phospho(1-nitrophenylethyl-2-cyanooethyl)-L-Tyrosine tert-butyl ester (400 mg, 0.66 mmol) was dissolved in methanol (MeOH, 15 mL) and potassium hydroxide (KOH, 1.3 mL of stock solution 34 mg/mL in water, 0.79 mmol) was added. After 10 minutes, TLC (R_f = 0.30, 1:10:90 EtO/MeOH/CH2Cl2) shows that the starting material has been consumed. The reaction mixture was poured into water (150 mL) with brine (50 mL) and acidified with HCl to pH ~ 1. The product was extracted with EtOAc (2 x 50 mL). The combined organic layers were dried over Na2SO4, decanted, and concentrated under reduced pressure to give the desired product as a white solid in quantitative yield. No further purification was necessary. 1H-NMR (400 MHz, CDCl3, δ): 1.38 (s, 9H), 1.63 (dd, 3H, J_HH = 2.7 Hz, J_HH = 3.5 Hz), 2.24-2.32 (m, 4H), 2.95-3.03 (m, 2H), 4.68 (br s, 1H), 4.96 (dd, J_HH = 1.4 Hz, J_HH = 10.2 Hz), 4.99 (dd, J_HH = 1.5 Hz, J_HH = 17.1 Hz), 5.70-5.78 (m, 1H), 6.08 (q, 1H, J_HH = 6.3 Hz), 6.27 (br s, 1H), 6.94-7.01 (m, 4H), 7.40 (t, 1H, J_HH = 8.1 Hz), 7.59 (t, 1H, J_HH = 7.5 Hz), 7.74 (dd, 1H, J_HH = 1.0 Hz, J_HH = 7.9 Hz), 7.93 (td, 1H, J_HH = 1.5 Hz, J_HH = 8.2 Hz), 10.85 (br s, 1H). 13C-NMR (100.6 MHz, CDCl3, δ): 172.5, 170.7, 149.6, 146.6, 137.9, 136.9, 134.1, 133.1, 130.8, 128.7, 128.0, 124.5, 120.0, 115.9, 82.8, 73.1, 53.7, 37.5, 35.5, 29.5, 28.1, 24.5. ESI-MS: [M+H]+ 549.1981 (obsd), 549.1996 (calcld).

N^4-4-pentenoyl-phospho(1-nitrophenylethyl)-L-Tyrosine cyanomethyl ester (6): N^4-4-pentenoyl-phospho(1-nitrophenylethyl)-L-Tyrosine tert-butyl ester (400 mg, 0.81 mmol) was dissolved in anhydrous CH2Cl2 (10 mL) and the resulting solution was cooled to 0 °C. TFA (10 mL) was slowly added to the reaction mixture, and the solution was stirred in the dark at 0 °C for 30 minutes, then at room temperature for another 30 minutes. The reaction mixture was concentrated under reduced pressure, then re-dissolved in CH2Cl2 and concentrated three times to remove the TFA. The resulting residue was dissolved in chloroacetonitrile (1 mL, 15.8 mmol), and DBU (607 µL, 4.06 mmol) was added dropwise to the mixture; the reaction was allowed to stir in the dark overnight. The reaction mixture was then diluted with EtOAc (50 mL) and washed with a mixture of water (50 mL), brine (150 mL) and 6M HCl (2 mL). The combined organic layers were dried over Na2SO4, decanted, and concentrated under reduced pressure to give a dark brown oil that was purified by reversed phase HPLC to give the desired product as a sticky solid in 47.0 % yield (201 mg, 95:5 to 5:95 water/acetonitrile/0.1%TFA over 30 minutes, R_f = 22.50 min). 1H-NMR (400 MHz, CDCl3, δ): 1.65 (dd, 3H, J_HH = 5.2 Hz, J_HH = 0.86 Hz), 2.29 (s, 4H), 2.96, 3.12 (m, 2H), 4.97 (d, 2H, J_HH = 1.1 Hz), 4.98 (dd, 2H, J_HH = 26 Hz, J_HH = 1.0 Hz), 5.64-5.79 (m, 1H), 6.06 (q, 1H, J_HH = 6.6), 6.72 (br s, 1H), 6.96-6.99 (m, 4H), 7.42 (td, 1H, J_HH = 7.7 Hz, J_HH = 1.3 Hz), 7.61 (td, 1H, J_HH = 7.6 Hz, J_HH = 0.95 Hz), 7.76 (dd, 1H, J_HH = 7.8, J_HH = 0.97), 7.92 (d, 1H, J_HH = 8.2 Hz), 10.4 (br s, 1H). 13C-NMR (100.6 MHz, CDCl3, δ): 174.1, 170.1, 150.0, 148.7, 137.8, 136.4, 134.2, 132.1, 130.6, 128.9, 128.1, 124.5, 120.5, 116.2, 114.1, 73.0, 53.4, 49.2, 36.7, 35.1, 29.4, 24.5. ESI-MS: [M+H]+ 532.1477 (obsd), 532.1485 (calcld).

Coupling to pdCpa (11): pdCpa (10) was synthesized as previously reported. In general, the coupling reactions were performed on a 20 to 50 µmol scale; additionally, the pdCpa (1.2 equivalents), N^4-4-pentenoyl-phospho(1-nitrophenylethyl)-L-Serine, -Threonine, or -Tyrosine cyanomethyl ester (1.0 equivalents), and tetrabutylammonium acetate (NBu4OAc) were dried under vacuum before use. A 250 mM solution of NBu4OAc was made in anhydrous N,N-dimethylformamide (DMF). The pdCpa was dissolved to 130 mM concentration with the NBu4OAc solution, and kept under inert atmosphere. This mixture was then added to the amino acid ester, and kept under inert atmosphere. The reaction was monitored by analytical reversed phase HPLC. When the amino acid ester was consumed, the reaction was quenched with 2:1 water/McCN with 0.1 % TFA (1:5 to 2.0 mL, or ~12 mM final concentration of product). The product was purified by reversed phase HPLC (93:7 to 0:100 water/McCN/0.1 % TFA over 35 minutes) and confirmed by ESI-TOF MS. pdCpa-4PO-cpSer, R_f = 23.23 min, [MNa]+ 1059.0, [MNa]2+ 530.0 (obsd), 1057.7, 529.3 (calcld); pdCpa-4PO-cpThr, R_f = 23.40 min, [MNa]+ 1072.9, [MH]+ 1049.0 (obsd), 1072.7, 1049.7 (calcld). pdCpa-4PO-cpTyr, R_f = 25.80 min, [MH]+ 1111.2, [M+2H]2+ 556.1 (obsd), 1111.0, 556.0 (calcld).
Aminoacyl-tRNA transcripts were run off as previously described. Extraction ethanol of standard sample with the correct sequence was stored at –20 °C for future use. Purified (Invitrogen, AGA Turbo) the correct sequence was kept for further use. Colonies performed VASP-WT were amplified as previously described. Both WT and S153TAG VASP genes were amplified from the pBS-ksII vectors using PCR with Pfu Turbo Polymerase and the following primers: forward 5'-GAG CGC CGG GTC TAG AAT GCA GGA GGC CC; antisense 5'-GGG CCT CCT GCA TIC TAG ACC CGG CGC TC. Several colonies were selected, DNA was purified by standard procedure, and submitted for sequencing; one sample with the correct sequence was kept for further use. The VASP gene was received from the Gertler Lab (Massachusetts Institute of Technology) in a pBS-ksII vector with an upstream T5 promoter. The site-specific mutagenesis was performed following the Stratagene QuikChange protocol and the following primers: sense 5' -GAG CGC CGG GTC TAG AAT GCA GGA GGC CC; antisense 5'-GGG CCT CCT GCA TIC TAG ACC CGG CGC TC. Several colonies were selected, DNA was purified by standard procedure, and submitted for sequencing; one sample with the correct sequence was kept for further use.

Both the WT and S153TAG VASP genes were amplified from the pBS-ksII vectors using PCR with Pfu Turbo Polymerase and the following primers: forward 5'-ACC ATG ACG GAC CGG GTC; reverse 5'-AGG AGA ACC CCG TCT CCT CAG. The products were purified by agarose gel electrophoresis and stored at -20 °C. The PCR products were then used in the TOPO directional cloning reaction as described by the manufacturer (Invitrogen, TOPO Directional Cloning: pCDNA3.1/V5-His). Several colonies were selected and plasmid DNA purified by standard procedure. The DNA was screened by a single restriction enzyme digest: Sal I will cut the empty vector into two pieces, 2.3 and 3.2 kb in length, while it will cut the pcDNA/VASP vectors into two pieces, 2.1 and 4.4 kb in length. Several samples with the insert were submitted for sequencing, and one of each plasmid sample with the correct sequence was stored at –20 °C for future use.

**mRNA run-off transcription:** Plasmid DNA of WT and S153TAG VASP was amplified in DH5α cells using standard protocol. Approximately 100 μg of each plasmid were linearized with Pmel (cuts immediately downstream of the C-terminal His-tag). Linearized DNA was purified by agarose gel electrophoresis followed by PCI extraction, ethanol precipitation, and re-dissolving in DEPC water. Run-off transcription of the genes was performed using the T7 mMessage mMach and ribozyme kit (Ambion) and following manufacturer protocol. The mRNA was purified by PCI extraction and stored at –80 °C. Analysis by glocral/agaorse gel confirmed the correct size of the transcripts. nAChR transcripts were run off as previously described.

**Aminoacyl-tRNA Deprotection:** 6-nitroveratryloxy carbonyl- (NVOC) protected aminoacyl-tRNA was (1 μg/μL) were deprotected by 5 minutes of irradiation with a 1000 W Hg/Xe arc lamp (Oriel, Stratford, CT) operating
at 400 W equipped with WG-335 and UG-11 filters (Schott, Elmsford, NY). 4-pentenoyl- (4PO) protected aminoacyl-tRNA_CUA were deprotected by a 10 minute incubation with 1 equivalent fresh saturated I₂ in H₂O. 4PO-protected aminoacyl-tRNA_CUA are stored at 2 μg/μL; the final concentration is 1 μg/μL after I₂ treatment.

**In Vitro Translation:** *In vitro* protein synthesis was carried out using the Promega (Madison, WI) rabbit reticulocyte lysate translation kit according to the manufacturer’s instructions. For nAChR translations, the following reagents were combined and incubated for 1 hour at 30 °C: 1.5 μL DEPC H₂O, 0.75 μL complete amino acids (1mM), 0.5 μL Roche (Basel, Switzerland) RNase inhibitor, 4 μL deprotected aminoacyl-tRNA_CUA (suppression: 1 μg/μL) or DEPC H₂O (unsuppressed), 1 μL mRNA (VASP-WT: 1.0 μg/μL, VASP-S153TAG: 0.1 μg/μL), and 16.25 μL lysate. For VASP translations, the following reagents were combined and incubated for 3 hours at 30 °C: 10 μL DEPC H₂O, 6 μL complete amino acids (1mM), 4 μL Roche (Basel, Switzerland) RNase inhibitor, 32 μL deprotected aminoacyl-tRNA_CUA (suppression: 1 μg/μL) or DEPC H₂O (unsuppressed), 8 μL mRNA (VASP-WT: 1.0 μg/μL, VASP-S153TAG: 0.1 μg/μL), and 140 μL lysate.

**Ni-NTA Purification of His-Tagged Proteins:** The following buffers were used in the purification and concentration of His-tagged VASP proteins:

- Buffer A: 100 mM NaH₂PO₄, 2% SDS, 2 mM β-mercaptoethanol, pH 8.0
- Buffer B: 50 mM NaH₂PO₄, 150 mM NaCl, 2 mM β-mercaptoethanol, pH 8.0
- Buffer C: 50 mM NaH₂PO₄, 150 mM NaCl, 2 mM β-mercaptoethanol, pH 7.0
- Buffer D: 50 mM NaH₂PO₄, 150 mM NaCl, 2 mM β-mercaptoethanol, pH 4.5
- Buffer E: 50 mM NaH₂PO₄, 150 mM NaCl, 2 mM β-mercaptoethanol, 1X BSA, pH 7.0.

400 μL Qiagen Ni-NTA Superflow (Valencia, CA) was washed three times with 400 μL Buffer B. 200 μL translation mix was then added, and the beads were washed with Buffer C, and then Buffer D. Buffers were blocked for 2 hours at room temperature with Buffer E, which was removed by pipetting. 2 X 400 μL Buffer B were added to each column and removed by pipetting (removes excess BSA). Loading Buffer A, Buffer C washes, and Buffer D elutions were then added to the columns and concentrated by centrifuging the columns at 4000 x g until their respective volumes were reduced to 40 μL. Buffer B was used to dilute the concentrated Buffer A, Buffer C, and Buffer D solutions to 100 μL (final pH ~6.6). Samples were then diluted to 0.5 hours at 30°C and stored at -80°C.

**λ–PPase Treatment:** λ-PPase dephosphorylation of murine VASP Ser153 is well-precedented. Dephosphorylation was performed with New England Biolabs (Beverley, MA) Lambda Protein Phosphatase (λ-PPase), according to the manufacturer’s instructions. VASP samples (WT: 2 μL, Suppressed: 10 μL) were dissolved in sterile H₂O to a total volume of 15.5 μL. 2 μL 20 mM MnCl₂, 2 μL λ-PPase Buffer, and 0.5 μL λ-PPase enzyme were added to a total volume of 20 μL. This mixture was incubated 0.5 hours at 30°C and stored at -80°C.

**PKA treatment:** PKA phosphorylation of murine VASP Ser153 is well-precedented. Phosphorylation was performed with New England Biolabs cAMP-dependent Protein Kinase (PKA), according to the manufacturer’s instructions. VASP samples (WT: 2 μL, Suppressed: 10 μL) were dissolved in sterile H₂O to a total volume of 15.5 μL. 2 μL 10 mM ATP, 2 μL PKA Buffer, and 0.5 μL PKA enzyme were added to a total volume of 20 μL. This mixture was incubated 0.5 hours at 30°C and stored at -80°C.

**Caging Group Photolysis:** Irradiation of the His-Tag purified VASP samples was performed with the arc lamp assembly described above (Aminoacyl-tRNA_CUA Deprotection). WT samples were treated with λ-PPase as described above; after dephosphorylation the 20 μL sample was irradiated for 5 minutes at room temperature. CSer and CpSer samples were diluted with sterile H₂O to a total volume of 15.5 μL, irradiated for 5 minutes at room temperature, and then treated with PKA or λ-PPase (respectively) as described above.

**nAChR PAGE Analysis:** PAGE samples were prepared by mixing 10 μL of unpurified rabbit reticulocyte translation mix with 4 μL 6X SDS gel loading buffer and diluting to a total volume of 24 μL. Samples were run at...
150 V on a 10% polyacrylamide Readygel (BioRad, Hercules, CA) in 1X Tris/Glycine/SDS buffer (10X stock from BioRad). Protein was transferred to nitrocellulose membrane, which was blocked with 5% milk in 1 X PBS (Irvine Scientific, Santa Ana, CA) with 0.1 % (v/v) Tween 20 (Sigma-Aldrich) for 1 hour. The blot was labeled with mouse anti-HA epitope primary antibody (Covance Research Products, Grand Rapids, MI) for 1 hour at a 1:3000 dilution in the 5% milk solution. After washing 3 times 1 X PBS + 0.1 % (v/v) Tween 20, the membrane was labeled for 1 hour with horse radish peroxidase-conjugated goat anti-mouse secondary antibody (Jackson Immunoresearch Laboratories, West Grove, PA). The blot was washed 3 times 1 X PBS + 0.1 % (v/v) Tween 20 and developed with Supersignal West Pico chemiluminescence reagents from Pierce (Rockford, IL) on Amersham (Buckinghamshire, England) Hyperfilm.

**Figure S2** Suppression efficiency in nAChR-A122TAG. Lanes (Left to Right): 1, WT translation; 2-7, A122TAG mRNA with tRNA\textsubscript{CUA} charged with amino acids listed above lanes. “No AA” refers to full length, but uncharged, tRNA. All lanes loaded with 10 µL. C\textsubscript{p}Tyr synthesis is described elsewhere."9

**VASP PAGE Analysis:** PAGE samples were prepared by mixing 4 µL 6X SDS gel loading buffer\textsuperscript{8} with one of the following: 2 µL of unpurified rabbit reticulocyte translation mix; 10 µL concentrated loading Buffer A, wash Buffer C, or elution Buffer D; 20 µL enzymatically-treated VASP. The final samples were diluted to 24 µL. Samples were run at 150 V on a 12% polyacrylamide Readygel (BioRad) in Tris/Glycine/SDS. Protein was transferred to nitrocellulose membrane, which was blocked with 5% BSA (minimum 96%, Sigma-Aldrich, St. Louis, MO) in 1 X PBS with 0.1 % (v/v) Tween 20 for 1 hour. The blot was labeled with rabbit anti-VASP primary antibody (a gift from the Gertler lab, Massachusetts Institute of Technology) for 1 hour at a 1:3000 dilution in the 5% BSA solution. After washing 3 times 1 X PBS + 0.1 % (v/v) Tween 20, the membrane was labeled for 1 hour with horse radish peroxidase-conjugated goat anti-rabbit secondary antibody (Upstate, Charlottesville, VA). The blot was washed 3 times 1 X PBS + 0.1 % (v/v) Tween 20 and developed as above.
Figure S3  Suppression efficiency in VASP-S153TAG. Lanes (Left to Right): 1, Molecular Weight Markers; 2, WT translation mix, unpurified (2 µL); 3, WT Buffer C Wash (10 µL); 4, WT Buffer D elution (2 µL); 5, S153TAG mRNA and tRNA\textsubscript{CUA}-CSer translation mix, unpurified (2 µL); 6, CSer Buffer C Wash (2 µL); 7, CSer Buffer D elution (10 µL); 8, S153TAG mRNA and tRNA\textsubscript{CUA}-CpSer translation mix, unpurified (2 µL); 9, CpSer Buffer C Wash (2 µL); 10, CpSer Buffer D elution (10 µL).
