Supporting Information

General Information. Commercial reagents were purified prior to use following the guidelines of Perrin and Armarego.\(^1\) Organic solutions were concentrated under reduced pressure on a Buchi rotary evaporator. Chromatographic purification of products was accomplished using forced-flow chromatography on ICN 60 32-64 mesh silica gel 63 according to the method described by Still.\(^2\) Thin-layer chromatography (TLC) was performed on EM Reagents 0.25 mm silica gel 60-F plates. Visualization of the developed chromatogram was performed by florescence quenching, anisaldehyde stain, or potassium permanganate stain.

\(^1\)H and \(^13\)C spectra were recorded on Bruker AM-400 (400 MHz and 100 MHz, respectively), Bruker DRX-500 (500 MHz and 125 MHz, respectively), Varian Mercury-300 (300 MHz and 75 MHz, respectively), or Varian I-500 (500 MHz and 125 MHz, respectively) instruments, as noted, and are internally referenced to residual protio solvent signals. Data for \(^1\)H are reported with chemical shift (\(\delta\) ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), integration, coupling constant (Hz), and assignment. Data for \(^13\)C are reported with chemical shift. IR spectra were recorded on an ASI React-IR 1000 spectrometer and are reported in terms of frequency of absorption (cm\(^{-1}\)). Optical Rotations were recorded on a Jasco P-1010 polarimeter (WI lamp, 589 nm, 25°C). Mass spectra were obtained from the UC Irvine Mass Spectral Facility. Gas Chromatography was performed on Hewlett-Packard 5890A and 6890 Series gas chromatographs equipped with a split-mode capillary injection system and flame ionization detectors using a Bodman Chiraldex Γ-TA (30 m x 0.25 mm) column,

Bodman Chiraldex β-DM (30 m x 0.25 mm) column or Bodman Chiraldex β-PH (30 m x 0.25 mm) column. HPLC analysis was performed on a Hewlett-Packard 1100 Series HPLC at 254 nm using the following Chiralcel columns: OD-H (25 cm) and OD guard (5 cm), AD (25 cm) and AD guard (5 cm).

**Preparation of 10-Phenyl-deca-2,7,9-trienal (3):**

10.0 g (24.10 mmol) of cinnamyltriphenylphosphonium chloride was added to 2.70 g (24.10 mmol) of t-BuOK in 100 mL Et₂O and the resulting solution was stirred at room temperature for 30 min. The reaction mixture was cooled to 0°C and 3.42 g (21.91 mmol) of the known aldehyde ester³ was added in 10 mL Et₂O. The solution was warmed to room temperature and stirred for 5 hrs. The solution was poured into 100 mL H₂O and extracted with Et₂O (3 x 50 mL). The combined organics were dried over Na₂SO₄, filtered through cotton, and dried in vacuo. The residue was purified by flash chromatography (10% EtOAc/ hexanes) to afford the trienyl ester as a 1:1 mixture of geometric isomers (diene). The mixture was redissolved in 50 mL of CH₂Cl₂ and 250 mg (0.98 mmol) I₂ was added. After 30 min, 20 mL Na₂SO₃ (saturated) were added and the layers were separated. The aqueous layer was extracted (2 x 20 mL) and the combined organics were dried over Na₂SO₄, filtered through cotton, and concentrated in vacuo to afford 3.54 g (63%) of trienyl ester as a yellow oil:

A solution of 1.77 g (6.90 mmol) of trienyl ester in 35 mL CH₂Cl₂ was cooled to -78°C and 2.7 mL (15.19 mmol) of DIBAL-H was added. After one hour, the reaction was allowed to warm to 0°C and 10 mL MeOH was added to quench the remaining DIBAL-H. To a solution of (6E,8E)-decadienol\textsuperscript{16} (1.7g, 11.0 mmol) in CH\textsubscript{2}Cl\textsubscript{2} (55mL) was added N-methyl morpholine (2.6 g, 22.0 mmol), followed by 300mg of 4Å molecular sieves. After stirring for 20 minutes, tetrapropylammonium perruthenate (77 mg, 0.22 mmol) was added to the mixture. The reaction was worked up after an additional 30 minutes by loading the black colored mixture onto a silica column and eluting with CH\textsubscript{2}Cl\textsubscript{2}. Most of the solvent was removed \textit{in vacuo} over an ice bath; due to the volatility of the aldehyde, the solution was not concentrated to dryness, and was immediately taken on to the next step.

The flask containing (6E,8E)-decadienal was charged with 20mL of THF, then treated with 3.8 g (10.6 mmol) of methyl (triphenylphosphoranylidene)acetate. The mixture was stirred for 12 hours, after which volatiles were removed \textit{in vacuo}. The resulting solid was triturated with diethyl ether (3 x 100mL), filtered, and the filtrate concentrated. The resulting crude yellow oily residue was purified by silica gel chromatography (5% EtOAc/Hexanes) to afford the title compound as an oil in 52% yield over 2 steps (1.19 g): IR (film) 3020, 2935, 2858, 1722,1661, 1437, 1274, 1197; \textsuperscript{1}H NMR (500 MHz, CDCl\textsubscript{3}) \(\delta\) 7.01-6.94 (m, 1H, CHCHCO\textsubscript{2}Me), 6.06-6.01 (m, 2H, CH=CH), 5.83 (d, \(J=9.3\) Hz, 1H, CO\textsubscript{2}MeCH), 5.65-5.51 (m, 2H, CH\textsubscript{2}CH\textsubscript{2}CH\textsubscript{3}), 3.72 (s, 3H, OCH\textsubscript{3}), 2.25-2.18 (m, 2H, MeO\textsubscript{2}CCCH\textsubscript{2}), 2.12-2.07 (m, 2H, CHCH\textsubscript{2}), 1.73 (d, \(J=9.0\) Hz, 3H, CHCH\textsubscript{3}), 1.52-1.40 (m, 4H, CH\textsubscript{2}CH\textsubscript{2}, CH\textsubscript{2}CH\textsubscript{2}); \textsuperscript{13}C NMR (125 MHz, CDCl\textsubscript{3}) \(\delta\) 167.4, 149.8, 131.8, 130.9, 129.6, 129.1, 121.2, 51.6, 32.8, 32.5, 32.3, 29.1, 27.8; HRMS (FAB+) exact mass calculated for (MH)+ requires \(m/z\) 209.1542, found \(m/z\) 209.1541.
