ABSTRACT: We study the plane wave limit of the Bäcklund transformations for the classical string in AdS space times a sphere and obtain an explicit expression for the local conserved charges. We show that the Pohlmeyer charges become in the plane wave limit the local integrals of motion of the free massive field. This fixes the coefficients in the expansion of the anomalous dimension as the sum of the Pohlmeyer charges.

1. Introduction

AdS/CFT correspondence is a strong/weak coupling duality. It maps the strongly coupled $\mathcal{N} = 4$ Yang-Mills theory to the type-IIB superstring theory on $AdS_5 \times S^5$. It is a useful tool for studying the dynamics of the strongly coupled Yang-Mills theory, but it would be even more important to use this duality to learn more about the string theory. AdS/CFT correspondence relates the string theory to the gauge field theory which at this time is understood much better than the string theory. It would be useful to learn how to rewrite the gauge theory in stringy degrees of freedom.

Recently the classical strings in $AdS_5 \times S^5$ were identified on the gauge theory side as coherent states in the sector of single-trace operators with the large R-charge [1–7]. The dynamics of such states is essentially classical because they are composed of the large number of partons (a large number of degrees of freedom).

It was conjectured that the number of partons is in the classical limit a conserved quantity [8]. We have argued in [9] (using the results of [10–12]) that this conserved quantity corresponds to a hidden symmetry of the classical string theory in $AdS_5 \times S^5$.

Classical string in $AdS_5 \times S^5$ is an integrable system [13–18]. An infinite family of local conserved charges was found by Pohlmeyer [19]. The hidden symmetry corresponding to the length of the operator is generated by an action variable; it is an infinite linear combination of the Pohlmeyer charges.

In this paper we will fix the coefficients of this infinite linear combination by considering the plane wave limit [20]. In the plane wave limit the worldsheet theory becomes the theory of free massive fields. Our action variable in this limit counts the total number of oscillators¹ in the excited state. We will apply the Bäcklund transformation in the plane wave limit and obtain in this limit an explicit expression for the generating function of the local conserved charges. We will find that the Pohlmeyer charges become the local conserved charges of the free massive fields, and that the oscillator number is indeed an infinite linear combination of them.

The explicit expression for the action variable and the arguments of [22] allow us to answer the following question: given the classical string worldsheet in $AdS_5 \times S^5$, how to compute the anomalous dimension of the corresponding field theory operator? The answer is given by eq. (4.16).

Integrability is a very useful feature of the AdS/CFT correspondence, and the plane wave limit provides an interesting tool for understanding the integrable structures. The worldsheet sigma-model can be understood in some regime as an integrable perturbation of the free massive theory. Integrable structure of the worldsheet theory was studied from this point of view in [23–25]. In particular, the plane wave limit of the commuting conserved charges (and the $1/R^2$ corrections) was studied on the classical and quantum level in [24, 25]. The way we use the plane wave limit here is somewhat similar to considerations in sections 2 and 3 of [26].

Note added in the revised version. In our work we use the Pohlmeyer’s definition of the local conserved charges based on the Bäcklund transformations. There is an alternative definition using the spectral invariants of the monodromy matrix, the quasimomenta. There is a particular linear combination of the quasimomenta which in the sector of fast moving strings has a regular expansion in the powers of the spectral parameter x near $x = 1$ and near $x = -1$ giving the left and right Pohlmeyer charges. The relation between this definition and the Pohlmeyer’s definition was explained in [27]. The expression for the anomalous dimensions in terms of the quasimomenta was obtained in [15–17]. We believe that Bäcklund transformations are important in the theory of integrable systems, and the advantage of the old Pohlmeyer’s definition is that it emphasizes the relation between the local conserved charges and the Bäcklund transformations. The relation between the action variable and the Bäcklund transformations is discussed in [28, 29].

The main subject of this paper is the fact that there is an action variable which has a linear expansion in the Pohlmeyer charges. In [28] and [29] we show that this is a consequence of the fact that the Bäcklund transformations are generated by the Pohlmeyer charges.

¹The oscillator number for strings in AdS was previously discussed in [21]. I want to thank A. Tseytlin for pointing my attention to this work.

The relation between our formula for the anomalous dimension and the results of [15–17] is discussed in [29].

2. $AdS_5 \times S^5$ and the plane wave

2.1 A special choice of coordinates in $AdS_5 \times S^5$

Let us consider the embeddings of AdS_5 as the hyperboloid $AdS_5 \subset \mathbf{R}^{2+4}$ and S^5 as the sphere $S^5 \subset \mathbf{R}^6$. Let X_{-1}, X_0, \dots, X_4 denote the coordinates of \mathbf{R}^{2+4} and Y_1, \dots, Y_6 the coordinates of \mathbf{R}^6 . The hyperboloid and the sphere are given by the equations

$$X_{-1}^2 + X_0^2 - \sum_{i=1}^4 X_i^2 = 1, \quad \sum_{i=1}^6 Y_i^2 = 1.$$

The metric of $AdS_5 \times S^5$ is:

$$ds^2 = R^2 \left[-dX_{-1}^2 - dX_0^2 + \sum_{I=1}^4 dX_I^2 + \sum_{J=1}^6 dY_J^2 \right]. \quad (2.1)$$

We will consider the string localized near the equator of the sphere. The following parametrization of $AdS_5 \times S^5$ is useful:

$$\begin{aligned} X_{-1} + iX_0 &= \left(1 + \epsilon^2 \sum_{j=1}^4 x_j^2 \right)^{\frac{1}{2}} \exp \left[i \left(x_+ - \frac{\epsilon^2}{2} x_- \right) \right] \\ Y_5 + iY_6 &= \left(1 - \epsilon^2 \sum_{j=1}^4 y_j^2 \right)^{\frac{1}{2}} \exp \left[i \left(x_+ + \frac{\epsilon^2}{2} x_- \right) \right] \\ X_i &= \epsilon x_i, \quad Y_i = \epsilon y_i, \quad (i = 1, 2, 3, 4) \end{aligned} \quad (2.2)$$

Here ϵ is a small parameter which is usually chosen to be of the order $1/R$. We will use the conformal coordinates on the worldsheet. This means that the embedding $x(\tau, \sigma)$ satisfies the constraints:

$$\begin{aligned} (\partial_\tau X)^2 + (\partial_\sigma X)^2 + (\partial_\tau Y)^2 + (\partial_\sigma Y)^2 &= 0 \\ (\partial_\tau X, \partial_\sigma X) + (\partial_\tau Y, \partial_\sigma Y) &= 0 \end{aligned} \quad (2.3)$$

With these constraints the equations of motion are:

$$\begin{aligned} (\partial_\tau^2 - \partial_\sigma^2)X - [(\partial_\tau X, \partial_\tau X) - (\partial_\sigma X, \partial_\sigma X)]X &= 0 \\ (\partial_\tau^2 - \partial_\sigma^2)Y + [(\partial_\tau Y, \partial_\tau Y) - (\partial_\sigma Y, \partial_\sigma Y)]Y &= 0 \end{aligned} \quad (2.4)$$

In the plane wave perturbation theory the embedding $x(\tau, \sigma)$ has a regular expansion in powers of ϵ . Let us describe the first approximation.

2.2 An approximate solution for the classical string

Let μ be a constant parameter. There is an approximate solution for which the eight “transverse” coordinates $x_1, \dots, x_4, y_1, \dots, y_4$ satisfy the plane wave equations of motion

$$\begin{aligned}(\partial_\tau^2 - \partial_\sigma^2)x_i + \mu^2 x_i &= 0 \\ (\partial_\tau^2 - \partial_\sigma^2)y_i + \mu^2 y_i &= 0\end{aligned}\tag{2.5}$$

with the constraint

$$\int_0^{2\pi} d\sigma [(\partial_\tau x_i, \partial_\sigma x_i) + (\partial_\tau y_i, \partial_\sigma y_i)] = 0.\tag{2.6}$$

To describe this solution we have to define $x_+(\tau, \sigma)$ and $x_-(\tau, \sigma)$. Let us introduce the functions $x_{-,A}(\tau, \sigma)$ and $x_{-,S}(\tau, \sigma)$ defined by the equations:

$$\partial_\tau x_{-,A} = -\frac{1}{2\mu} \sum_{i=1}^4 [(\partial_\tau x_i)^2 + (\partial_\sigma x_i)^2 - \mu^2 x_i^2] - \partial_\tau \phi\tag{2.7}$$

$$\partial_\sigma x_{-,A} = -\frac{1}{\mu} \sum_{i=1}^4 (\partial_\tau x_i, \partial_\sigma x_i) - \partial_\sigma \phi\tag{2.8}$$

$$\partial_\tau x_{-,S} = -\frac{1}{2\mu} \sum_{i=1}^4 [(\partial_\tau y_i)^2 + (\partial_\sigma y_i)^2 - \mu^2 y_i^2] + \partial_\tau \phi\tag{2.9}$$

$$\partial_\sigma x_{-,S} = -\frac{1}{\mu} \sum_{i=1}^4 (\partial_\tau y_i, \partial_\sigma y_i) + \partial_\sigma \phi\tag{2.10}$$

where ϕ is an arbitrary function of τ, σ satisfying $(\partial_\tau^2 - \partial_\sigma^2)\phi = 0$. The results of the calculations in this paper do not depend on the choice of ϕ . We will use $\phi = c\sigma$ with a constant² c . We put:

$$\begin{aligned}x_+ &= \mu(\tau - \tau_0) + \frac{\epsilon^2}{2}(x_{-,S} - x_{-,A}) \\ x_- &= (x_{-,S} + x_{-,A}).\end{aligned}\tag{2.11}$$

This solves (2.4) approximately, the right hand side of (2.4) is of the order ϵ^3 . It is possible to modify the definition of $x_{-,A}$ and $x_{-,S}$ by the terms of the order ϵ^2 and higher, so that the modified solution solves the constraints (2.3) exactly. These corrections will not spoil the equations of motion (2.4) in the order ϵ^2 ; we will not need the explicit formula for these correcting terms in this paper.

2.3 Relation between μ and angular momentum

The string worldsheet action in the plane wave region is:

$$\begin{aligned}S &= \frac{1}{2} \frac{1}{2\pi} \int d\sigma d\tau \left[2\partial_\tau x_+ \partial_\tau x_- - (\partial_\tau x_+)^2 (x^2 + y^2) + (\partial_\tau x)^2 + (\partial_\tau y)^2 + \right. \\ &\quad \left. + \epsilon^2 \partial_\tau x_+ \partial_\tau x_- (x^2 - y^2) + \epsilon^2 ((y, \partial_\tau y) - (x, \partial_\tau x)^2) + \dots \right].\end{aligned}$$

²A nonzero c may be needed if we want $x_{-,A}$ and $x_{-,S}$ to be periodic functions of σ . The sum $x_{-,S}(\tau, \sigma) + x_{-,A}(\tau, \sigma)$ is periodic in σ because of (2.6).

Here ... denotes the terms which do not contain time derivatives and the terms of the higher order in ϵ^2 . We will write y^2 or (y, y) instead of $\sum_{j=1}^4 y_j y_j$. The vector field $\partial/\partial x_-$ is a Killing vector. The corresponding momentum up to the terms of the order $o(\epsilon^2)$ is

$$\begin{aligned} M\left(\frac{\partial}{\partial x_-}\right) &= \frac{1}{2\pi} \int d\sigma \partial_\tau x_+ \left(1 + \frac{\epsilon^2}{2}(x^2 - y^2)\right) \\ &= \mu - \frac{\epsilon^2}{4\mu} \frac{1}{2\pi} \int d\sigma [(\partial_\tau y)^2 + (\partial_\sigma y)^2 + \mu^2 y^2 - (\partial_\tau x)^2 - (\partial_\sigma x)^2 - \mu^2 x^2]. \end{aligned}$$

The Killing vector field $\frac{1}{\epsilon^2} \frac{\partial}{\partial x_-} + \frac{1}{2} \frac{\partial}{\partial x_+}$ is periodic with the period 2π . Let us denote J the corresponding angular momentum. We have:

$$M\left(\frac{\partial}{\partial x_-}\right) = \epsilon^2 \left(J - \frac{1}{2} M\left(\frac{\partial}{\partial x_+}\right) \right). \quad (2.12)$$

The momentum corresponding to $\frac{\partial}{\partial x_+}$ up to the terms of the order ϵ^2 is

$$\begin{aligned} M\left(\frac{\partial}{\partial x_+}\right) &= \frac{1}{2\pi} \int d\sigma [\partial_\tau x_- - \partial_\tau x_+(x^2 + y^2)] \\ &= -\frac{1}{2\mu} \frac{1}{2\pi} \int d\sigma [(\partial_\tau y)^2 + (\partial_\sigma y)^2 + \mu^2 y^2 + (\partial_\tau x)^2 + (\partial_\sigma x)^2 + \mu^2 x^2]. \end{aligned}$$

Therefore

$$\mu = \epsilon^2 \left(J + \frac{1}{2\mu} \frac{1}{2\pi} \int d\sigma [(\partial_\tau y)^2 + (\partial_\sigma y)^2 + \mu^2 y^2] \right) + o(\epsilon^2). \quad (2.13)$$

3. Bäcklund transformations and Pohlmeyer charges

3.1 Bäcklund transformations

We will restrict ourselves to the case when $x_1 = \dots = x_4 = 0$, which means that the string fluctuates only in S^5 ; the projection of the worldsheet to AdS_5 is a fixed timelike geodesic. We will discuss the general case $x_i \neq 0$ at the end of the paper. Consider the Bäcklund transformation which does not change the AdS part of the worldsheet X but changes the S^5 part $Y \rightarrow Y'$:

$$\begin{aligned} \partial_+(Y' + Y) &= \frac{1}{2}(1 + \gamma^{-2})(Y', \partial_+ Y)(Y' - Y) \\ \partial_-(Y' - Y) &= -\frac{1}{2}(1 + \gamma^2)(Y', \partial_- Y)(Y' + Y). \end{aligned} \quad (3.1)$$

Here γ is a constant parameter. We will also use the notation $Y(\gamma) = Y'$. Notice that

$$(Y', Y) = \frac{1 - \gamma^2}{1 + \gamma^2}. \quad (3.2)$$

Let us apply the transformation $Y \rightarrow Y'$ in the plane wave limit. At the zeroth order in ϵ^2 we get:

$$(Y', \partial_+ Y) = -\frac{\mu}{2} \sin[\mu(\tau'_0 - \tau_0)] + O(\epsilon^2)$$

and $(Y', \partial_- Y) = (Y', \partial_+ Y) + O(\epsilon^2)$. Eqs. (3.1) at the zeroth order in ϵ^2 :

$$\begin{aligned} \partial_\tau \left(e^{i\mu(\tau-\tau'_0)} + e^{i\mu(\tau-\tau_0)} \right) &= -\frac{\mu}{2}(1 + \gamma^{-2}) \sin[\mu(\tau'_0 - \tau_0)] \left(e^{i\mu(\tau-\tau'_0)} - e^{i\mu(\tau-\tau_0)} \right) \\ \partial_\tau \left(e^{i\mu(\tau-\tau'_0)} - e^{i\mu(\tau-\tau_0)} \right) &= \frac{\mu}{2}(1 + \gamma^2) \sin[\mu(\tau'_0 - \tau_0)] \left(e^{i\mu(\tau-\tau'_0)} + e^{i\mu(\tau-\tau_0)} \right). \end{aligned}$$

This implies that $\tan \left[\frac{\mu}{2}(\tau'_0 - \tau_0) \right] = \pm\gamma$. We will choose the plus sign³. Let us introduce α :

$$\tan \alpha = \gamma.$$

With this notation $\tau'_0 = \tau_0 + 2\mu^{-1}\alpha$. Then up to the terms of the order ϵ^2 we have:

$$y' = \frac{\mu - 2 \tan \alpha \partial_+}{\mu + 2 \tan \alpha \partial_+} y = \frac{2\partial_- + \mu \tan \alpha}{2\partial_- - \mu \tan \alpha} y. \quad (3.3)$$

We can use (3.2) to find the transformation $x_{-,S} \rightarrow x'_{-,S}$:

$$x'_{-,S} - x_{-,S} = \frac{\cos 2\alpha}{2 \sin 2\alpha} (y^2 + (y')^2) - \frac{1}{\sin 2\alpha} (y, y'). \quad (3.4)$$

The parameter μ^{-1} is the small parameter of the null-surface perturbation theory. In the leading order in $1/\mu$ we have $\partial_+ \simeq \frac{1}{2}\partial_\tau$ and the Bäcklund transformation is just a time shift:

$$\begin{aligned} Y' &= \exp(-2\alpha\mu^{-1}\partial_\tau)Y \\ &= \cos(2\alpha)Y - \sin(2\alpha)\mu^{-1}\partial_\tau Y \\ &= \frac{1 - \gamma^2}{1 + \gamma^2} Y - \frac{2\gamma}{1 + \gamma^2} \frac{\partial_\tau Y}{|\partial_\tau Y|}. \end{aligned} \quad (3.5)$$

This formula follows directly from (3.1). We have used that $\partial_\tau^2 Y = -\mu^2 Y$ in the limit $\mu \rightarrow \infty$. Therefore we should consider $\mu^{-1}\partial_\tau$ to be of the order 1 in the $1/\mu$ -expansion. We can define the Bäcklund transformations in the null-surface perturbation theory as perturbative solutions of (3.1) which are power series in μ^{-1} , the first approximation given by (3.5). The corrections to (3.5) by the higher powers of μ^{-1} involve higher derivatives in τ and σ and depend on γ as rational functions. When γ is small we can expand these corrections in powers of γ , and when γ is large in powers of γ^{-1} . Therefore the definition of the Bäcklund transformation as a power series in $1/\mu$ agrees with the usual definition as a power series in γ or $1/\gamma$.

3.2 Pohlmeyer charges

The generating function for the conserved charges is given by:

$$\mathcal{E}(\gamma) = \frac{1}{2\pi} \int d\sigma [\gamma(Y(\gamma), \partial_+ Y) + \gamma^3(Y(\gamma), \partial_- Y)] \quad (3.6)$$

³The relations (3.1) are symmetric in Y and Y' . Therefore there are two solutions for Y' . Given one solution $Y' = Y(\gamma)$ the other one is $Y(-\gamma)$.

$$\begin{aligned}
 = \gamma \frac{1}{2\pi} \int d\sigma \left\{ -\frac{\sin 2\alpha}{2 \cos^2 \alpha} \mu + \right. \\
 + \epsilon^2 \left[\frac{1}{2 \cos^2 \alpha} (y', \partial_\tau y) + \frac{1 \cos 2\alpha}{2 \cos^2 \alpha} (y', \partial_\sigma y) + \right. \\
 + \frac{1 \sin 2\alpha}{2 \cos^2 \alpha} \left[\frac{\mu}{2} (y^2 + (y')^2) - \partial_\tau x_{-,S} \right] + \\
 \left. \left. + \frac{1 \cos 2\alpha}{2 \cos^2 \alpha} [\mu(x'_{-,S} - x_{-,S}) - (\partial_\tau y, y)] \right] \right\}. \tag{3.7}
 \end{aligned}$$

The free field y has an oscillator expansion:

$$y^i(\tau, \sigma) = \sum_{n=-\infty}^{\infty} \sum_{i=1}^4 \frac{1}{\sqrt{2\omega_n}} \left(\alpha_n^i e^{in\sigma + i\omega_n \tau} + \bar{\alpha}_n^i e^{-in\sigma - i\omega_n \tau} \right) \tag{3.8}$$

where $\omega_n = \sqrt{\mu^2 + n^2}$. We will suppress the index i and write $\sum_n \alpha_n \bar{\alpha}_n$ instead of $\sum_{n=-\infty}^{\infty} \sum_{i=1}^4 \alpha_n^i \bar{\alpha}_n^i$. The Bäcklund transformation for the oscillators is:

$$y' = \frac{\mu - 2 \tan \alpha \partial_+}{\mu + 2 \tan \alpha \partial_+} y \quad \Rightarrow \quad \alpha'_n = \frac{\mu - i \tan \alpha (\omega_n + n)}{\mu + i \tan \alpha (\omega_n + n)} \alpha_n. \tag{3.9}$$

The oscillator expansion of (3.7) is:

$$\mathcal{E}(\gamma) = -\gamma^2 \mu + \epsilon^2 \frac{\gamma^2}{\mu} \mathcal{H}_2 + \epsilon^2 \gamma^2 \hat{\mathcal{E}}_+(\gamma) \tag{3.10}$$

where

$$\mathcal{H}_2 = \frac{1}{4\pi} \int d\sigma [(\partial_\tau y)^2 + (\partial_\sigma y)^2 + \mu^2 y^2] = \sum \omega_n \alpha_n \bar{\alpha}_n \tag{3.11}$$

and

$$\hat{\mathcal{E}}_+(\gamma) = - \sum_n \frac{\mu}{\omega_n - \cos 2\alpha n} \alpha_n \bar{\alpha}_n. \tag{3.12}$$

Taking into account (2.13) we get

$$\mathcal{E}(\gamma) = -\epsilon^2 \gamma^2 J + \epsilon^2 \gamma^2 \hat{\mathcal{E}}_+(\gamma). \tag{3.13}$$

This is the generating function for the “left” Pohlmeyer charges. In the generating function for the “right” charges we replace $\hat{\mathcal{E}}_+(\gamma)$ with $\hat{\mathcal{E}}_-(\gamma)$ which is obtained from $\hat{\mathcal{E}}_+(\gamma)$ by replacing $n \rightarrow -n$. We can also consider the average of the left and right generating functions:

$$\mathcal{E}^{\text{even}}(\gamma) = -\epsilon^2 \gamma^2 J + \epsilon^2 \gamma^2 \hat{\mathcal{E}}^{\text{even}}(\gamma) \tag{3.14}$$

where

$$\hat{\mathcal{E}}^{\text{even}}(\gamma) = - \sum_n \frac{\mu \omega_n}{\omega_n^2 - (\cos 2\alpha)^2 n^2} \alpha_n \bar{\alpha}_n. \tag{3.15}$$

3.3 A relation between \mathcal{E}_+ and \mathcal{E}_-

Eq. (3.12) can be also written in the following way:

$$\begin{aligned}\hat{\mathcal{E}}_{\pm}(\gamma) &= -(1 + \gamma^2) \sum_n \frac{\mu(\omega \pm n)}{\mu^2 + \gamma^2(\omega \pm n)^2} \alpha_n \overline{\alpha_n} \\ &= - \sum_n \frac{\mu(\omega \pm n)}{\mu^2 + \sin^2 \alpha [(\omega \pm n)^2 - \mu^2]} \alpha_n \overline{\alpha_n}.\end{aligned}\quad (3.16)$$

It is usually understood that $\mathcal{E}(\gamma)$ is the generating function of the conserved charges; it is defined as a power series in γ . But we see from (3.16) that the expansion in powers of $\sin^2 \alpha = \frac{\gamma^2}{1+\gamma^2}$ is in fact the expansion in powers of the expression $\left[\frac{(\omega \pm n)^2}{\mu^2} - 1\right]$ which is small in the null-surface limit $\mu \rightarrow \infty$. Therefore we can analytically continue $\mathcal{E}(\gamma)$ to finite values of γ . It follows from $\omega^2 - n^2 = \mu^2$ that

$$\hat{\mathcal{E}}_+(\gamma) = \hat{\mathcal{E}}_-(\gamma^{-1}). \quad (3.17)$$

This identity follows from the definitions (3.1), (3.6). Eq. (3.1) defines the left Bäcklund transformation $Y \rightarrow Y'$. The definition of the right Bäcklund transformation $Y \rightarrow Y''$ differs from (3.1) by $\partial_+ \leftrightarrow \partial_-$. With this definition $Y'(\gamma) = -Y''(-\gamma^{-1})$. Now (3.17) follows from the formula (3.6) for the generating function.

4. An action variable in the plane wave limit

4.1 Action variable and local conserved charges of the free massive theory

The hamiltonian of the plane wave theory is:

$$H = \frac{1}{4\pi} \int d\sigma \sum_{i=1}^4 [p_i^2 + q_i^2 + (\partial_\sigma x_i)^2 + (\partial_\sigma y_i)^2 + \mu^2(x_i^2 + y_i^2)] \quad (4.1)$$

where $p_i(\sigma) = \partial_\tau x_i$ and $q_i(\sigma) = \partial_\tau y_i$ are the momenta conjugate to x_i and y_i respectively:

$$\{p_i(\sigma), x_j(\sigma')\} = 2\pi\delta(\sigma - \sigma'), \quad \{q_i(\sigma), y_j(\sigma')\} = 2\pi\delta(\sigma - \sigma'). \quad (4.2)$$

Consider the following action variable:

$$\mathcal{I} = \frac{1}{4\pi} \int d\sigma \left[y_i(\sigma) \sqrt{\mu^2 - \partial_\sigma^2} y_i(\sigma) + q_i(\sigma) \frac{1}{\sqrt{\mu^2 - \partial_\sigma^2}} q_i(\sigma) \right]. \quad (4.3)$$

This quantity is conserved and generates periodic trajectories. In the oscillator language:

$$\mathcal{I} = \sum_n \alpha_n \overline{\alpha_n}. \quad (4.4)$$

On the other hand the free massive theory has an infinite family of local conserved charges:

$$\begin{aligned}I_k &= \frac{1}{4\pi} \sum_{i=1}^4 \int d\sigma \left[q_i \partial_\sigma^{2k-2} q_i - y_i \partial_\sigma^{2k} y_i + \mu^2 y_i \partial_\sigma^{2k-2} y_i \right] \\ &= (-1)^{k+1} \times \sum_n n^{2k-2} \omega_n \alpha_n \overline{\alpha_n}.\end{aligned}\quad (4.5)$$

One can see that \mathcal{I} is an infinite linear combination of I_k :

$$\begin{aligned} \mathcal{I} &= \frac{1}{4\pi} \sum_{i=1}^4 \int d\sigma \left[\mu y_i y_i - \sum_{n=0}^{\infty} \mu^{-2n-1} \frac{(2n)!}{2^{2n+1}(n+1)!n!} y_i \partial_{\sigma}^{2n+2} y_i + \right. \\ &\quad \left. + \sum_{n=0}^{\infty} \mu^{-2n-1} \frac{(2n)!}{2^{2n}(n!)^2} q_i \partial_{\sigma}^{2n} q_i \right] \\ &= \sum_{n=0}^{\infty} \mu^{-2n-1} \frac{(2n)!}{2^{2n}(n!)^2} I_{n+1}. \end{aligned} \tag{4.6}$$

In this section we will show that I_k descend from the Pohlmeyer charges of the sigma model on S^5 . We will argue that eq. (4.6) provides an expression for the action variable in terms of the local conserved charges (which is valid not only in the plane wave limit).

4.2 Integral formula

There is an integral formula:

$$\frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{d\gamma}{1+\gamma^2} \hat{\mathcal{E}}_+(\gamma) = \frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{d\gamma}{1+\gamma^2} \hat{\mathcal{E}}_-(\gamma) = - \sum_n \alpha_n \bar{\alpha}_n. \tag{4.7}$$

This means that:

$$J + \sum_n \alpha_n \bar{\alpha}_n = - \frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{d\gamma}{\gamma^2(1+\gamma^2)} \mathcal{E}(\gamma). \tag{4.8}$$

This is an integral representation for the action variable in terms of the conserved charges. We derived this formula in the plane wave limit, but we conjecture that it is valid also outside of the plane wave limit. In other words, the right hand side of (4.8) should generate periodic trajectories on the phase space of the classical string in $AdS_5 \times S^5$. We will give an argument in favor of this at the end of section 4.4.

4.3 Expansion in powers of n/μ

Let us rewrite (3.15) in the following way:

$$\hat{\mathcal{E}}^{\text{even}}(\gamma) = - \sum_n \frac{\sqrt{1+(n/\mu)^2}}{1+(n/\mu)^2(\sin 2\alpha)^2} \alpha_n \bar{\alpha}_n. \tag{4.9}$$

Notice that $(\sin 2\alpha)^2 = \frac{4\gamma^2}{(1+\gamma^2)^2}$. Let us define the local conserved charges $\hat{\mathcal{E}}_{2k}$ as follows:

$$\hat{\mathcal{E}}^{\text{even}}(\gamma) = \sum_{k=0}^{\infty} \gamma^{2k} \hat{\mathcal{E}}_{2k}. \tag{4.10}$$

One can verify the following identities:

$$\begin{aligned} \hat{\mathcal{E}}_0 + \frac{1}{8} \hat{\mathcal{E}}_2 &= - \sum \left(1 + o\left(\frac{n^2}{\mu^2}\right) \right) \alpha_n \bar{\alpha}_n \\ \hat{\mathcal{E}}_0 + \frac{11}{64} \hat{\mathcal{E}}_2 + \frac{3}{128} \hat{\mathcal{E}}_4 &= - \sum \left(1 + o\left(\frac{n^4}{\mu^4}\right) \right) \alpha_n \bar{\alpha}_n \end{aligned}$$

$$\hat{\mathcal{E}}_0 + \frac{201}{1024}\hat{\mathcal{E}}_2 + \frac{11}{256}\hat{\mathcal{E}}_4 + \frac{5}{1024}\hat{\mathcal{E}}_6 = - \sum \left(1 + o\left(\frac{n^6}{\mu^6}\right)\right) \alpha_n \overline{\alpha_n}$$

$$\hat{\mathcal{E}}_0 + \frac{3461}{16384}\hat{\mathcal{E}}_2 + \frac{949}{16384}\hat{\mathcal{E}}_4 + \frac{185}{16384}\hat{\mathcal{E}}_6 + \frac{35}{32768}\hat{\mathcal{E}}_8 = - \sum \left(1 + o\left(\frac{n^8}{\mu^8}\right)\right) \alpha_n \overline{\alpha_n}.$$

These equations agree with the results of [10, 11] (see the discussion in [9]). In the next order we have:

$$\hat{\mathcal{E}}_0 + \frac{29011}{131072}\hat{\mathcal{E}}_2 + \frac{569}{8192}\hat{\mathcal{E}}_4 + \frac{4661}{262144}\hat{\mathcal{E}}_6 + \frac{49}{16384}\hat{\mathcal{E}}_8 + \frac{63}{262144}\hat{\mathcal{E}}_{10} = - \sum \left(1 + o\left(\frac{n^{10}}{\mu^{10}}\right)\right) \alpha_n \overline{\alpha_n}. \tag{4.11}$$

4.4 An infinite linear combination of local conserved charges

Instead of expanding \mathcal{E} in powers of γ let us now expand it in powers of $(\sin 2\alpha)^2 = \frac{4\gamma^2}{(1+\gamma^2)^2}$. Define \mathcal{G}_k as follows:

$$\mathcal{E}^{\text{even}}(\gamma) = \epsilon^2 \gamma^2 \sum_{k=0}^{\infty} \left[\frac{4\gamma^2}{(1+\gamma^2)^2} \right]^k \mathcal{G}_k. \tag{4.12}$$

Then eqs. (4.5) and (4.9) imply that in the plane wave limit

$$- \mathcal{G}_k = \mu^{-1-2k} I_{k+1} + \delta_{k,0} J. \tag{4.13}$$

Therefore \mathcal{G}_k are the “improved” currents of [10, 11]. Indeed, the density of the k -th improved current is proportional to $|p_S|^{1-2k}$ where $p_S = \partial_\tau x_S$ is the push-forward of $\frac{\partial}{\partial \tau}$ by the embedding of the string worldsheet in the S^5 ; it is assumed that τ and σ are conformal coordinates on the worldsheet and σ is periodic with the period 2π . The plane wave limit keeps the terms quadratic in y . The typical term is $\int d\sigma |p_S(\sigma)|^{1-2k} (\partial_\sigma^k Y, \partial_\sigma^k Y)$. In the plane wave limit $|p_S| \simeq \mu$ and $Y \simeq \epsilon y$. Therefore in the plane wave limit this quadratic term will be of the form $\epsilon^2 \mu^{1-2k} \int d\sigma (\partial_\sigma^k y, \partial_\sigma^k y)$ which is in agreement with (4.13) and (4.5).

We conjecture that the conserved charges \mathcal{G}_k defined from the generating function by eq. (4.12) are “exactly improved” (proportional to $|p|^{1-2k}$ not only in the plane wave limit). We have not proven this. What has to be proven is the *existence* of the improved charges. Once the existence is proven, the improved charges provide a canonical basis in the space of all the local conserved charges and the coefficients of the expansion (4.12) are just the coefficients of the expansion of \mathcal{E} in this basis. There must be many ways to determine these coefficients, in particular from the plane wave limit, as we did here.

Eqs. (3.13) and (4.9) imply that the action variable is an infinite sum of \mathcal{G}_k :

$$J + \sum_{n=-\infty}^{\infty} \sum_{i=1}^4 \alpha_n^i \overline{\alpha_n^i} = - \sum_{k=0}^{\infty} \frac{1}{2^{2k}} \frac{(2k)!}{(k!)^2} \mathcal{G}_k. \tag{4.14}$$

We have so far considered only the S^5 part of the string worldsheet. Therefore the Pohlmeyer charges \mathcal{G}_k which we considered should be really denoted \mathcal{G}_k^S . The index S tells us that these charges came from the S^5 sigma model. One can introduce in the same way the Pohlmeyer charges \mathcal{G}_k^A in the AdS_5 sigma model. We would get:

$$E - \sum_{n=-\infty}^{\infty} \sum_{i=1}^4 \beta_n^i \overline{\beta_n^i} = - \sum_{k=0}^{\infty} \frac{1}{2^{2k}} \frac{(2k)!}{(k!)^2} \mathcal{G}_k^A. \tag{4.15}$$

Here β_n^i are the Fourier modes of $x^i(\tau, \sigma)$. Arguments of [22] show that the anomalous dimension has the following expansion in these charges:

$$\frac{1}{2\pi} \log c^2 = \sum_{k=0}^{\infty} \frac{1}{2^{2k}} \frac{(2k)!}{(k!)^2} (\mathcal{G}_k^S - \mathcal{G}_k^A). \quad (4.16)$$

We derived this expression from the plane wave limit, but it should be valid for all classical strings in $AdS_5 \times S^5$, at least in the perturbative expansion around the null-surfaces [9, 12, 22]. Indeed, we have argued in [9] that there is a universal (in the fast moving sector) expansion of the action variable as an infinite linear combination of the local conserved charges. The coefficients of this expansion are just numbers, and therefore can be fixed from the plane wave limit.

Under the assumption that the charges \mathcal{G}_k defined by eq. (4.12) are exactly improved, the integral formula (4.8) is equivalent to the expansion (4.14). Indeed, if we substitute in the integral formula (4.8) the expansion (4.12), we get eq. (4.14).

Eq. (4.16) agrees with the usual definition of the anomalous dimension in the plane wave limit as $E - J - \sum_{n=-\infty}^{\infty} \sum_{i=1}^4 (\alpha_n^i \overline{\alpha_n^i} + \beta_n^i \overline{\beta_n^i})$.

Acknowledgments

I want to thank I. Swanson and A. Tseytlin for interesting discussions, and M. Srednicki for asking the question. This research was supported by the Sherman Fairchild Fellowship and in part by the RFBR Grant No. 03-02-17373 and in part by the Russian Grant for the support of the scientific schools NSh-1999.2003.2.
