PREFACE

The purpose of the present report is to supply cross-referenced index lists which will facilitate the location of earthquake records from particular earthquakes and sites. These lists and the accompanying maps will also serve as a complete description of the location of all stations.

A secondary purpose of the report is to collect in one place various corrections, addenda, and supplementary information which should assist research workers in making use of the data.

THE STRONG MOTION ACCELEROGRAm ANALYSIS PROJECT

The first strong-motion accelerogram was obtained during the 1933 Long Beach earthquake, and it was immediately recognized that such measurements would be of fundamental importance to the newly developing field of earthquake engineering. From the very beginning of the accelerograph program, the U.S. Coast and Geodetic Survey, which initiated and maintained the work, was aware of the need for a wide distribution of this basic data and in the 1933 issue of U.S. Earthquakes began a notable series of reproductions of small-scale copies of accelerograms along with a summary of instrumental characteristics, site characteristics, and tabulation of peak accelerations, prominent wave periods, etc. Included in these reports were a number of pioneering studies of accelerograph analysis by Frank Neumann, based on such early records as the 1940 El Centro accelerogram. The importance of the work of the Seismological Field Survey of the U.S. Coast and Geodetic Survey in the development, installation, servicing of instruments, and in the collection and dissemination of data cannot be overestimated. Under the direction first of Franklin P. Ulrich and later of William K. Cloud, the Seismological Field Survey laid the indispensable foundation for later studies of strong-motion seismology.

By the late 1940's the number of significant strong-motion accelerograms had grown to several dozen, and new methods for analysis and interpretation of the records had been developed. The usefulness of response spectrum techniques to characterize the effect

of earthquake ground motion on structures had been generally accepted, and computational capabilities had rapidly advanced. In 1951 the first compilation of strong-motion records in a standard form, along with response spectrum plots, etc., was published by the California Institute of Technology. This report by Alford, Housner, and Martel, "Spectrum Analysis of Strong-Motion Earthquakes," contained information on 14 earthquake accelerograms processed by electric analog computer methods. Re-issued in 1964 with four additional accelerograms, this report received a wide distribution and was for a number of years the main source of basic information on strong-motion acceleration data.

Important advances were also being made in the integration of accelerograms to obtain ground velocity and displacement curves. It was recognized that digital computer techniques combined with long-period baseline corrections would permit an increase in accuracy over a fairly wide frequency range. In 1961 Berg and Housner presented a standard baseline correction of parabolic form which has been widely used and has only recently been superceded by more powerful digital filter techniques developed in the course of the present project.

By the late 1960's, the number of strong-motion earthquake accelerograms had grown to the point that some form of standard data processing was essential. It was also clear at that time that modern developments in data processing techniques made it practicable to extract considerably more information from past accelerograms than had been originally supposed. This made it desirable to re-work many of the older original accelerograms. These considerations

resulted in a decision in 1968 by the Earthquake Engineering Research Laboratory of the California Institute of Technology to carry out a program of digitization and data processing which would ensure a wide dissemination of the basic data in a form convenient for use by all investigators. At that time, a group of 100 accelerograms was selected from the available records to form the nucleus of such a data bank.

The objectives of this initial project as expressed in the preface to the first report (July, 1969) were as follows:

"The object of the present series is to make available accurate digitized data prepared in a uniform way for all recorded strong-motion earthquakes. This first report is the initial step in a continuing data processing program which will ultimately include all past recorded earthquakes as well as current data as it is collected. In addition to digitized ground acceleration records, certain basic calculated information such as integrated velocity and displacement curves, response spectra, and Fourier spectra, will also be issued in a standard form. The existence of this standardized data will allow all investigators to begin with the same basic numerical data, and should thus reduce the scatter of numerical results, the meaning of which has sometimes been difficult to assess.

"In addition to an improvement in the consistency of numerical results, several other advantages will be derived from the standardized data. (1) A number of earthquake records will be available which have not hitherto been analyzed in any form; (2) Vertical component data will be available for all earthquakes, digitized on a simultaneous time basis with the two horizontal components; (3) A small overall improvement in data accuracy will result from the inclusion of corrections for base-line distortion on the original record, and for timing mark variations; (4) Basic accelerogram data uncorrected for base-line adjustments will be available for research purposes, as well as corrected data using standard adjustments.

"Accurate measurements of the ground motions of destructive earthquakes form the indispensable starting point for investigations in earthquake engineering. The number of such measurements that have been made in the past is

unfortunately very small, and there is thus a need to extract the maximum possible information from the relatively few records that do exist. ...

"Some of the factors which suggest that a uniform preparation of information is now essential are: (1) The basic accelerograph itself has gone through many stages of development, and the network now contains a wide variety of devices differing considerably in mechanical, electrical, and optical details. Although the basic physical parameters are approximately equivalent, there are significant differences which sometimes can be corrected for if the proper information is at hand. (2) A wide variety of recording media and record sizes are employed in the various accelerographs, and many different techniques have been used over the years to digitize the analog photographic traces for numerical work. (3) Various important earthquake accelerograms have been studied by different investigators using different interpretive techniques. In addition, various corrective methods have been employed, and it is not always clear for a given reproduced accelerogram just how the basic data has been treated. (4) As modern digital computing techniques have been developed, there has been a continuous evolution of the data processing techniques used. For example, response spectrum calculations have been carried out by desk calculators, by analog computer methods, and by digital computers. This may complicate the comparison of old spectrum curves with more recent calculations. Integrated velocity and displacement curves are well known to be particularly sensitive to this kind of computational variation. The foregoing factors, plus the fact that highly efficient digitizing and computing facilities are now available, have provided the motive for the present undertaking."

The project as outlined above had just been well started under the auspices of the National Science Foundation, and the first two data reports had been prepared, when the 1971 San Fernando earthquake provided another 241 valuable records. This not only greatly increased the scope of the program, but provided additional justification for the feeling that to catch up with the growing backlog of records was a "now or never" proposition.

Coincident with the expanded data processing program necessitated by the San Fernando earthquake was the establishment of the "National Information Service for Earthquake Engineering" by the National Science Foundation as a joint activity of the California Institute of Technology and the University of California at Berkeley. The establishment of NISEE and several subsequent supplementary grants from the National Science Foundation made it possible to carry the data processing forward at a more rapid pace than had been originally contemplated and finally to bring the whole program to a successful conclusion.

Questions as to when and how to terminate a program of this type naturally presented themselves at an early stage. The flow of accelerograms is continually increasing as the number of instruments in the field grows, and the data processing element must of course be a permanent feature of the earthquake engineering research system. It was always supposed that after the backlog of older accelerograms had been eliminated, and the basic principles of an adequate data processing technique firmly established, the routine problems of keeping the record up to date might well be transferred from Caltech to an appropriate governmental organization. As a matter of fact, this termination and transfer process was much facilitated by the recent reorganization of several governmental agencies having various responsibilities in strong-motion seismology. As a consequence of these rearrangements, responsibility for strong-motion engineering seismology was assigned to the National Science Foundation in May, 1973. At that time, NSF agreed to provide program policy, management, and funding, and selected the U.S. Geological

Survey to be the operating agency to carry out the program through its newly formed Seismic Engineering Branch. A major function of the SEB is the installation and maintenance of the U.S. strong-motion accelerograph network, and the basic program of data processing and dissemination is thus a very logical part of their mission.

It was accordingly decided to terminate the specific data processing project at the California Institute of Technology with the final records from the San Fernando earthquake. The total number of three-component accelerograms in the uniformly-processed data bank reached the final number of 381. It will perhaps be of some interest to summarize the main characteristics of this data bank. Of the 381 records, 187 are from ground sites, mainly basements of buildings, which over the frequency range of interest can be taken as essentially free-field ground stations for most of the sites. The remaining records are for various upper floor and roof locations which can serve as the basis for various structural response calculations. The records come from 57 different earthquakes, ranging from magnitudes as small as $M = 3$ to the maximum $M = 7.7$ of the Kern County earthquake.

The 187 ground stations are located at a wide variety of site conditions. The sites were for the most part originally selected by engineers as the locations of important structures. Detailed studies of the local soil and geological conditions are available for only a small number of the stations - the completion of such studies is an important task for the future. Most site conditions can only be roughly characterized as: relatively soft, as on alluvium;

intermediate, as on sedimentary rock; and hard, as on crystalline bedrock. With this classification it may be noted that about 60% of the ground records are from soft sites, 30% from intermediate sites, and 10% from hard sites.

The station recording the largest number of earthquakes is that at El Centro, which since 1934 has produced accelerograms from 16 earthquakes. The earthquake producing the most records is of course the San Fernando earthquake of 1971, which generated 241 records, 98 of them from ground sites. Other earthquakes in the data bank producing multiple records include the Borrego Mountain of 1968 with 15 records and the Lytle Creek 1970 with 36 records.

The basic information in the data bank is available in three different forms. First, it is contained in a series of 100 reports, which include complete digital printouts, plotted curves, and supporting data on the earthquakes, the instruments, and the sites, along with considerable reference material. The reports are organized in a series of four volumes, each with 25 parts:

Volume I	Uncorrected Digitized Accelerograms - Print-outs and Computer Plots
Volume II	Corrected Accelerograms. Integrated Velocity and Displacements
Volume III	Response Spectrum Curves. Linear and Three-Way Logarithmic Plots
Volume IV	Fourier Amplitude Spectra. Linear and Logarithmic Plots.

In the index tables of the present report, the letters refer to the individual parts of each volume. Thus, for example, the complete data on the 1934 El Centro earthquake would be found in

Volume IB, Volume IIB, Volume IIIB, and Volume IVB, and in each volume it would be record no. 024.

Attention is directed to the fact that Part A of each volume contains introductory and background material which gives details on methods used, applications of the data, references, etc. Volume II, Part G contains additional information on the assessment of long period errors, and Volume IV, Part Q,R,S further studies of high frequency errors.

All of the data reports are available in either paper copy or on microfiche through the National Technical Information Service, U.S. Department of Commerce, Springfield, VA, 22151. A table in the present report gives the NTIS numbers which will facilitate ordering.

A second form in which the standard data are available is as standard punched cards. This is a convenient way in which to acquire computer-compatible information for one or a few particular earthquakes. The cards can be supplied at a nominal cost for reproduction and mailing.

A third form in which the data can be supplied is as computer-compatible digital magnetic tape. This is the most convenient arrangement for users who expect to use data from many earthquakes. The complete data for each volume, including all 381 records, is contained on one tape which can be supplied at the nominal reproduction cost of \$100 (includes postage in the U.S.).

More detailed information on any of the above forms can be obtained by writing to:

Earthquake Engineering Research Laboratory
Thomas Laboratory, 104-44
California Institute of Technology
Pasadena, California 91125

In coming to the conclusion of this program, we naturally feel very grateful to many people and to many organizations. In addition to the key role played by the National Science Foundation in all aspects of the program, the Earthquake Research Affiliates of the California Institute of Technology have also made many important contributions of financial support and general encouragement. It is hoped that the devoted services of numerous staff members have been suitably acknowledged in the various individual reports at appropriate points. It is my personal pleasure to tender special thanks to the two individuals who have been most responsible for the successful completion of the project. Professor M. D. Trifunac directed the way to major improvements in every aspect of the project, and by means of his patient labor and high critical standards, made it possible to carry out the program at a considerably higher level than had been originally planned. Dr. A. G. Brady provided the continuous careful supervision necessary to grapple with the myriad of small details involved in the computations, checking, and publication of a large mass of data. His never-failing good humor in the face of the inevitable vicissitudes of such an undertaking was a major factor in our success.

D. E. Hudson
Professor of Mechanical Engineering
and Applied Mechanics
Division of Engineering and
Applied Science

*From "Strong-Motion Instrument Station Data," Open File Report, June 11, 1975, Seismic Engineering Branch, U.S. Geological Survey.

**Note that these locations in decimal degrees may differ slightly from the values given in degrees, minutes, and seconds in the headings for the individual records in Volume II. In some cases the locations have been revised or corrected.

†See "Station Number Revisions", p. 30.

STATION NUMBER REVISIONS

The following old station numbers appearing in earlier reports of the U.S. Coast and Geodetic Survey are no longer in use (stations were temporary or otherwise eliminated):

- No. 27 Grapevine, Tehachapi Pumping Plant, removed (temporary CWD station) (M179)
- 112 Cedar Springs CWD site, replaced by nearby Nos. 557, 558 on completed dam (O203, W336)
- 113 Colton, removed (F101, W339, Y370)
- 125 Lake Hughes No. 1. Replaced by nearby station 1a No. 828 (J141, X364)
- 135 Hollywood Storage Parking lot - removed (new station to be set up about 20 ft. away) (A007, D058, W347, Y380)
- 136 L.A. Subway Terminal - removed (V314, Y378)

The following stations had never been assigned numbers:

Helena, Montana, Federal Bldg. - temporary after 1935 earthquake (U295, 296, 297)

Tehachapi Fire House - temporary after 1952 Kern County Earthquake (U302, 303, 304)

Southern California Edison Bldg. - removed (Y377)

L.A. Chamber of Commerce - building removed, replaced by Occidental Bldg. having basement station no. 437 (V317)

The following station numbers have been changed by the USGS
to achieve a more logical regional numerical classification:

No.	4	has become	No.

SUMMARY OF CORRECTIONS AND ADDITIONS

Volume I

Vol. I, Part A. p. 15, Record IA16, change "N09E" to "S09E" and "N81W" to "S81W".

Vol. I, Part B. p. 13, Record IB21, Vernon, Mar. 10, 1933, 1754 PST, component N82W; units are seconds and G/100 instead of G/10.

Vol. I, Part C. Change orientation of record C041 (Pacoima Dam) from "S16E" to "S14W" and from "S74W" to "N76W" on pp. 3, 6, 7, 8, 9, 11, 18, 255, 256, 257, 258.

Vol. I, Part C. p. 30. The last two lines on the left half page have been blocked out. The last three lines should read:

36.355	0.038	36.387	-0.042	36.412	0.004	36.441	-0.064
36.452	-0.043	36.481	0.045	36.492	0.037	36.522	-0.010
36.536	0.007	36.562	-0.039	36.575	-0.035	36.601	0.003

Vol. I, Part C. p. 47, Record IC044, component S74W (new N76W) ordinate at 1.323 seconds is -0.020.

Vol. I, Part D. pp. 2, 5. Change address of station location for records ID059, 60, 61 from "1900 Avenue of Stars" to "1901 Avenue of Stars." On pp. 93, 100, 107, 132, 134 add the "1901" to the address in the heading.

Vol. I, Part G. p. 5, Record IG111. Jet Propulsion Laboratory, Pasadena. The upper instrument is on the roof, effectively the 10th not the 9th floor. Change "9th floor" to "roof" in headings pp. 179, 189, 200, 289.

Vol. I, Part I. Record II131, 132, 133. Change location address from 420 N. Roxbury Dr. to 450 N. Roxbury Dr.

Vol. I, Part M. Record IM180, 181, 182. Change location address from 4000 W. Chapman Ave. to 1 City Blvd.

Vol. I, Part Q. Record IQ236. Interchange "SOUTH" and "EAST" components on pp. 9, 67, 74.

Vol. I, Part Q. Record IQ238. Increase all time coordinates by the factor 1.022 (see Vol. II, Part Q, pp. 2, 3).

Vol. I, Part S. Record IS265. On pp. 187, 191, 195 in headings, change address from 3411 Wilshire Blvd. to 3435 Wilshire Blvd.

Vol. I, Parts T, U, V, W, X, Y. Delete the subtitle "Accelerograms from the San Fernando, California, Earthquake of February 9, 1971" from the front cover.

Vol. I, Part V. Title on front cover should be changed from "Part V - Accelerograms IIIV314 through IIIV333" to "Part V - Accelerograms IV314 through IV333."

Vol. I, Part W. Record IW334, in heading for p. 18, change "S25W" to "DOWN"; p. 23, change "DOWN" to "S25W"; p. 208, interchange accelerograms for S25W and DOWN.

Vol. I, Part Y. p. 2, add to the location list "10. CMD Building, Vernon, California."

Volume II

Vol. II, Part B. pp. 2-5. Note discussion of component direction definitions (see also Vol. III, Part B, p. 10).

Vol. II, Part C. Record IIC041 (Pacoima Dam) change orientation of record from "S16E" to "S14W" and from "S74W" to "N76W" on pp. 4, 8, 9, 10, 12, 13, 15, 16, 19, 21, 22, 24, 25, 27, 28, 54, 57, 63, 64, 66, 68, 72, 74, 78, 79, 81, 83, 87, 89.

Vol. II, Part D. Record IID056. On p. 10, heading, replace -16.5 CM/SEC by -17.2 CM/SEC; p. 11, heading, replace -27.2 CM/SEC by -27.8 CM/SEC, and 9.3 CM by 9.5 CM; p. 12, heading, replace -6.2 CM/SEC by -6.4 CM/SEC. Replace tables of pp. 55, 56, 57, 58 by tables of pp. 35, 36, 37, 38 of the present report.

Vol. II, Part G. Note pp. 6-38 "Current Assessment of Long-Period Errors."

Vol. II, Part H. Note pp. 4-6, summary of long-period error study.

Vol. II, Part I. Records III131, 132, 133. Change location address from 420 N. Roxbury Dr. to 450 N. Roxbury Dr.

Vol. II, Part I. Record II I138. On pp. 46 and 137, in headings, change "BASEMENT" to "9th FLOOR".

Vol. II, Part L,M. Records IIM180, 181, 182. Change location address from 4000 W. Chapman Ave. to 1 City Blvd.

Vol. II, Part O,P. Note p. 13, revised epicenter location of San Fernando earthquake.

Vol. II, Part Q,R. Record IIQ238, note pp. 2-3, time corrections.

Vol. II, Part T. pp. 6, 7. Note information on elimination of low amplitude records.

Volume III

Vol. III, Part A. Note the corrections to component directions of Part A listed on pp. 10, 11, Vol. III, Part B.

Vol. III, Parts G through Y. Note the information on long-period errors summarized on pp. 3, 4, Vol. III, Part G. See also Vol. II, Part G.

Vol. III, Part I. Records IIII131, 132, 133. Change location address from 420 N. Roxbury Dr. to 450 N. Roxbury Dr. in Preface material.

Vol. III, Part I. Record IIII138. On pp. 142 and 143 in headings, change "BASEMENT" to "9th FLOOR".

Vol. III, Part M, N. Records IIIM180, 181, 182, change location address from 4000 W. Chapman Ave. to 1 City Blvd.

Vol. III, Part Q, R. Record IIIQ238. All periods are to be multiplied by 1.022 (see Vol. II, Part Q, R, pp. 2, 3).

Vol. III, Part S. Records IIIS271, 272. Note information on timing of these records given in Vol. IV, Part Q, R, S, pp. 3, 4.

Vol. III, Part S. Record IIIS265. Change address from 3411 Wilshire Blvd. to 3435 Wilshire Blvd. in headings on pp. 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147.

Volume IV

Vol. IV, Part A. Note the component direction information for Part A given in Vol. IV, Part B, p. 10.

Vol. IV, Part A. Abstract and p. 4. Note that it was decided not to include the building transfer functions in the standard data volumes.

Vol. IV, Part A. p. 39. Note that the spectra of Vol. IV have been calculated in a different way than the Fourier spectra of Vol. III. The Vol. III spectra will be more accurate at higher frequencies than the Vol. IV spectra.

Vol. IV, Part I. Records IVII131, 132, 133. Change location address from 420 N. Roxbury Dr. to 450 N. Roxbury Dr. in Preface material.

Vol. IV, Part I. Record IVII138. In headings pp. 76 and 77, change "BASEMENT" to "9th FLOOR".

Vol. IV, Part J, K, L, M. Records IVM180, 181, 182. Change location address from 4000 W. Chapman Ave. to 1 City Blvd.

Vol. IV, Part Q, R, S. p. 3. Note information on timing of Records IVS271 and IVS272.

Vol. IV, Part Q, R, S. pp. 10-20. Note information on high frequency errors.

TABLE IV. PEAK ACCELERATIONS

The peak acceleration values which have been included in the headings of Volume II have been read from the equi-spaced data of Volume II which has a time interval of 0.02 seconds. For certain high frequency records, this time interval is not small enough to define the peak values of the original accelerogram. The digitization of Volume I, however, does include all peak values of the original records, since it has been carried out on an unequal time basis aimed at defining all significant features of the record.

Table IV gives the peak acceleration values as read from Volume I and compares them with those printed in Volume II. It will be noted that the differences are usually largest in the vertical components, since they have in general higher frequency components. These Volume I peak accelerations have not been corrected for transducer response, which would increase slightly some of the higher frequency peaks.

The peak velocity and displacement data of Volume II are not subject to this difficulty, since at the lower frequencies involved the 0.02 second time interval does accurately define the peak values.

TABLE IV
PEAK ACCELERATIONS

RECORD NUMBER	COMP.	IN G'S			
		VOLUME I	ACCEL.	VOLUME II	I/II
TIME	ACCEL.	TIME
