Journal of Geophysical Research, Solid Earth, 2013

This file contains:

- A detailed explanation of the Principal Component Analysis Method (PCAİM).
- Figure S1: Location of continuous GPS stations.
- Figure S2: CGPS time series with prediction from the inversion models for stations installed before the 2003 Chengkung earthquake.
- Figure S3: CGPS time series with prediction from the inversion models for stations installed after the 2003 Chengkung earthquake.
- Figure S4: Resolution of the various inversions.
- Figure S5: Checkerboard resolution test.
- Figure S6: Long term slip rate on the Longitudinal Valley Fault.
- Figure S7: Interseismic Coupling model, predicted vertical velocities for GPS.
- Figure S8: Test of robustness of the iterative method used to derive Interseismic Coupling.
- Figure S9: Misfit between measured and reconstructed displacements as the weight put on smoothing ( $\lambda$ ) increases.
- Figure S10: GPS and accelerometers vertical predicted displacements from the coseismic model.
- Figure S11: Misfit between time series (GPS and creepmeter stations) and reconstructed displacements from the PCA decomposition as the number of principal components increases.
- Figure S12: Time functions of the first four principal components for the postseismic modeling.
- Figure S13: Postseismic principal slip distribution for the four first principal components.
- Figure S14: Postseismic model, predicted vertical velocities for GPS.
- Figure S15: Postseismic model, predicted leveling data.
- Figure S16: Postseismic model, predicted ALOS data.
- Figure S17: Time functions of the first three principal components for the preseismic modeling.
- Figure S18: Preseismic principal slip distribution for the three first principal components.
- Figure S19: Preseismic model, predicted vertical velocities for GPS.
- Figure S20: Leveling data from, Ching et al, 2011. Published dataset and prediction from the inversions.
- Figure S21: Seismicity around the LVF
