

Supplementary Fig. 4. Surface plasmon resonance binding data. Binding data were derived from assays of the interaction of mono- and multivalent Fvs with HD Exon 1 fusion proteins containing 10, 16, 25, 39 or 46 glutamines. Binding data for the tetrameric Fv are shown only for injections over HD Exon 1 proteins coupled at medium coupling density (Table 3). In each panel, the injected protein is listed before an arrow pointing to the immobilized protein. The model used to fit the data is listed along with the derived K_D . K_D s are listed for the binding experiment shown and thus may differ slightly from average values reported in Table 3.
