## Supplementary Material

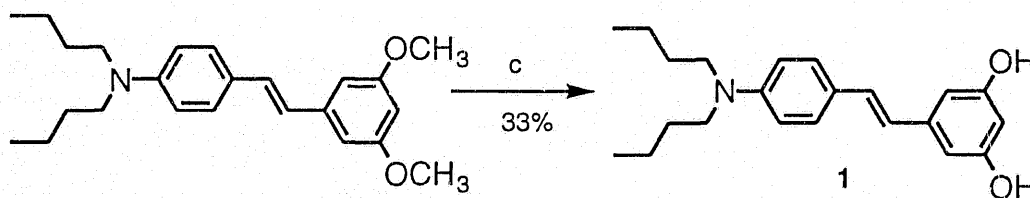

The three-step reactions started with the preparation of N, N-dibutylaminobenzyltriphenylphosphonium iodide (89% isolated yield) according to the pertinent literature (Bredereck, H.; Simchen, G.; Griebenow, W. *Chem. Ber.* **1973**, *106*, 3732). The phosphonium salt was then condensed with 3,5-dimethoxybenzaldehyde by a Wittig reaction to generate (4-N,N-dibutylamino)(3',5'-dimethoxy)stilbene (91% isolated yield). The methoxy groups of stilbene were demethylated by BBr<sub>3</sub> under a mild condition to yield **1** (33% isolated yield).

a: 1) (C<sub>6</sub>H<sub>5</sub>)<sub>3</sub>P, KI, CHCl<sub>3</sub>, H<sub>2</sub>O, HOAc, 37% HCOH, room temperature, 6 weeks. 2) recrystallization from ethanol.

b: 1) 3,5-dimethoxybenzaldehyde, sodium ethoxide, ethanol, 50 °C, 12 hours. 2) recrystallization from 60% aqueous ethanol.

c: 1) 3 equiv. BBr<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C 6 hours, room temperature 18 hours. 2) HCl<sub>(aq)</sub>/diethyl ether. 3) K<sub>2</sub>CO<sub>3</sub>(aq), neutralize to pH ~ 6. 4) recrystallization from benzene/hexanes.
