

```

% This script uses 'Definitions_uncoupled.m' and
% 'Equations_uncoupled.m' to
% then solve for the time dependent solution of sulfur and carbon
% in the whole ocean
% based on equations that have:
% 1. CaCO3 output based on a first order rate law with DIC
% 2. The Org C output value based on DIC-Corg fractionation with
% modernish
% values of 27 permil
% 3. The reduced sulfur output is tied to the organic carbon
% output via
% the classic Berner ratio of 1-3 wt %
% 4. The oxidized sulfur output (evaporites) is a constant (steady
% state solution based % on a first order
% rate law with [SO4].)
% 5. using foram carbonate +1permil as the overall ocean d13C.

% Set the initial conditions

Definitions_uncoupled;

% Set the initial condition of the ecf to be identical to seawater

c0 = zeros(4,1);

%%%%%%%%%%%%% Sulfur Initial Conditions %%%%%%%
